Díaz Rodríguez,2016-06-08 One of the major limitations of the Ambient Intelligent Systems today is the lack of semantic models of those activities on the environment so that the system can recognize the specific activity being performed by the user s and act accordingly In this context this thesis addresses the general problem of knowledge representation in Smart Spaces The main objective is to develop knowledge based models equipped with semantics to learn infer and monitor human behaviours in Smart Spaces Moreover it is easy to recognize that some aspects of this problem have a high degree of uncertainty and therefore the developed models must be equipped with mechanisms to manage this type of information As an added value this system should be sufficiently simple and flexible to be managed by non expert users and thus facilitate the transfer of research to industry To do this we develop graphical models to represent human behaviour in Smart Spaces in order to provide them with more usability in the final application As a result human behaviour recognition can help assisting people with special needs such as independent elders in remote rehabilitation monitoring industrial process guidelines and many other cases Human-Computer Interaction: Interaction Techniques and Environments Julie A.
