Protótipos De Um Microgerador Eólico: Saulo De Oliveira Garré, Adriane Prisco Petry, 2017-02-21 Este trabalho apresenta a avaliação experimental em túnel aerodinâmico das características de dois aerogeradores de pequeno porte com cinco pás. Para isso utilizando-se prototipagem 3D construíram-se dois modelos em escala reduzida os quais foram avaliados primeiramente utilizando-se Pstimas de Betz e depois Pstimas de Betz Modificadas. Antes de se avaliar o equipamento determinou-se a distribuição de velocidades na seção transversal do túnel com o auxílio de um tubo de Pitot. Com o perfil de velocidades do túnel conhecido determinou-se o torque estático do protótipo com o uso de um torquímetro digital acoplado ao eixo do equipamento que registrou todas as leituras para as faixas de velocidade de 1 m/s até 9,88 m/s. Também com o torquímetro avaliou-se a influência da posição angular das pás no torque medido. Para tanto elas foram projetadas móveis no hub o que possibilitou variar sua angularidade em relação ao escoamento mudando assim o ângulo de ataque e por conseguinte o torque produzido. Empregou-se um fototacômetro para medir a rotação do modelo em giro livre. Com os dados obtidos determinou-se a curva de torque estático e a curva de RPM em função da velocidade incidente. Através da determinação experimental do perfil de velocidade incidente e do perfil de velocidade na esteira aerodinâmica de cada turbina foi avaliada a variação da quantidade de movimento do escoamento e determinada a potência extraída pelos rotores em rotação livre. Este estudo visa contribuir com o projeto de um aerogerador real prevendo as características aerodinâmicas que o equipamento apresentar-se-á construído com o presente layout. Com os dados analisados fez-se uma previsão para as curvas de potência dos protótipos. Os resultados experimentais de torque e potência demonstraram boa aproximação com os resultados obtidos por avaliação analítica pelo método do elemento de pá. A prototipagem 3D administrada mostrou-se eficaz traduzindo realismo e excelente custo-benefício. A turbina construída com Pstimas de Betz apresentou torque estático 17,8% superior construída com as Pstimas Modificadas e extraiu 22% a mais de potência do escoamento de ar. This paper presents the experimental evaluation in wind tunnel of two small wind turbines features five blades. Therefore using 3D prototyping two models were built on a reduced scale which were first evaluated using Optimal Blade Betz and Optimal Blade Betz Modified. Prior to evaluating the distribution machine at speeds determined in the tunnel cross section with the aid of a Pitot tube. With the known tunnel velocity profile determines the static torque of the prototype with the use of a digital torque meter coupled to the machine axis which recorded all the readings for the speed range of 1 m/s to 9.88 m/s. Also with the torque meter evaluates the influence of the angular position of the blades in the measured torque. Therefore it is mobile designed in the hub allowing vary their angle in the outflow thereby changing the angle of attack and therefore the torque produced. Employed a photo tachometer for measuring the rotation of the model in free spin. With the data determines the static torque curve and RPM curve as a function of incident speed. Through experimental determination of the incident velocity profile and the velocity profile in the aerodynamic wake of each turbine is evaluated the variation of the amount of movement of the flow and determined the power extracted by the rotor in free

rotation This study aims to contribute to the design of a real wind turbine informing the aerodynamic characteristics of the equipment shall be constructed with this layout With the data analyzed to make a prediction for the prototype power curves The experimental results demonstrate torque and power good approximation to the results obtained by evaluation by analytical element of the paddle method The turbine constructed with Optimal Betz Blades presented static torque 17.8% higher than constructed with the Modified Blades and extracted 22% more power air outflow
