Innovations in Educational Change David Hung, Shu-Shing Lee, Yancy Toh, Azilawati Jamaludin, Longkai Wu, 2019-08-07 This book offers an ecological perspective to understand the opportunities and complexities of spreading and sustaining educational innovations. It explores the imperatives underpinning educational reforms and identifies the role of schools in developing, disseminating and sustaining changes in Singapore's educational context. It also includes international case studies that examine the dialectical relationships between structure, people and culture and demonstrate that cultivating ecologies involves leveraging affordances and resources across the education system to create new contexts, synergies and capacities. Further, it argues that educational innovations and reforms also need to consider tacit knowledge and conditions of transfer, which may be ambiguous and challenging. Few books address the nuances and interactions of innovation and change across levels of the education ecology, from the micro classroom, meso organisation, school, exo partners, macro policy and chrono time scales. The ecological perspective adopted in this book explores the dynamic tensions in order to understand the interplays of policy and school level influences that contextualize school innovations. By presenting multiple voices and views, it allows impediments and affordances of innovation diffusion to be discussed holistically, which is an integral caveat for nurturing a sustainable ecology that enables innovations.

Cellular Automata And Complexity Stephen Wolfram, 2018-03-08 Are mathematical equations the best way to model nature? For many years, it had been assumed that they were. But in the early 1980s, Stephen Wolfram made the radical proposal that one should instead build models that are based directly on simple computer programs. Wolfram made a detailed study of a class of such models known as cellular automata and discovered a remarkable fact: that even when the underlying rules are very simple, the behaviour they produce can be highly complex and can mimic many features of what we see in nature. And based on this result, Wolfram began a program of research to develop what he called A Science of Complexity. The results of Wolfram's work found many applications from the so-called Wolfram Classification central to fields such as artificial life to new ideas about cryptography and fluid dynamics. This book is a collection of Wolfram's original papers on cellular automata and complexity. Some of these papers are widely known in the scientific community; others have never been published before. Together, the papers provide a highly readable account of what has become a major new field of science with important implications for physics, biology, economics, computer science and many other areas.
