Ravishankar Rao,Guillermo A. Cecchi,Ehud Kaplan,2016-03-17 The amount of data being produced by neuroscientists is increasing rapidly driven by advances in neuroimaging and recording techniques spanning multiple scales of resolution The availability of such data poses significant challenges for their processing and interpretation To gain a deeper understanding of the surrounding issues the Editors of this e Book reached out to an interdisciplinary community and formed the Cortical Networks Working Group and the genesis of this e Book thus began with the formation of this Working Group which was supported by the National Institute for Mathematical and Biological Synthesis in the USA The Group consisted of scientists from neuroscience physics psychology and computer science and meetings were held in person A detailed list of the group members is presented in the Editorial that follows At the time we started in 2010 the term big data was hardly in existence though the volume of data we

were handling would certainly have qualified. Furthermore there was significant interest in harnessing the power of supercomputers to perform large scale neuronal simulations and in creating specialized hardware to mimic neural function. We realized that the various disciplines represented in our Group could and should work together to accelerate progress in Neuroscience. We searched for common threads that could define the foundation for an integrated approach to solve important problems in the field. We adopted a network centric perspective to address these challenges as the data are derived from structures that are themselves network like. We proposed three intertwined threads consisting of measurement of neural activity, analysis of network structures deduced from this activity and modeling of network function leading to theoretical insights. This approach formed the foundation of our initial call for papers. When we issued the call for papers we were not sure how many papers would fall into each of these threads. We were pleased that we found significant interest in each thread and the number of submissions exceeded our expectations. This is an indication that the field of neuroscience is ripe for the type of integration and interchange that we had anticipated. We first published a special topics issue after we received a sufficient number of submissions. This is now being converted to an e book to strengthen the coherence of its contributions. One of the strong themes emerging in this e book is that network based measures capture better the dynamics of brain processes and provide features with greater discriminative power than point based measures. Another theme is the importance of network oscillations and synchrony. Current research is shedding light on the principles that govern the establishment and maintenance of network oscillation states. These principles could explain why there is impaired synchronization between different brain areas in schizophrenics and Parkinson's patients. Such research could ultimately provide the foundation for an understanding of other psychiatric and neurodegenerative conditions. The chapters in this book cover these three main threads related to cortical networks. Some authors have combined two or more threads within a single chapter. We expect the availability of related work appearing in a single e book to help our readers see the connection between different research efforts and spur further insights and research.

Soft Methods for Integrated Uncertainty

Modelling Jonathan Lawry, Enrique Miranda, Alberto Bugarin, Shoumei Li, Maria Angeles Gil, Przemyslaw Grzegorzewski, Olgierd Hryniewicz, 2007-10-08. The idea of soft computing emerged in the early 1990s from the fuzzy systems community and refers to an understanding that the uncertainty, imprecision and ignorance present in a problem should be explicitly represented and possibly even exploited rather than either eliminated or ignored in computations. For instance Zadeh defined Soft Computing as follows. Soft computing differs from conventional hard computing in that unlike hard computing it is tolerant of imprecision, uncertainty and partial truth. In effect the role model for soft computing is the human mind. Recently soft computing has to some extent become synonymous with a hybrid approach combining AI techniques including fuzzy systems, neural networks and biologically inspired methods such as genetic algorithms. Here however we adopt a more straightforward definition consistent with the original concept. Hence soft methods are understood as those uncertainty

formalisms not part of mainstream statistics and probability theory which have typically been developed within the AI and decision analysis community. These are mathematically sound uncertainty modelling methodologies which are complementary to conventional statistics and probability theory.

The Scientific Foundation of Neuropsychological Assessment Elbert Russell, 2011-12-08 Neuropsychology is a specialized branch of psychology which focuses on the relationship between the brain and human functions including cognition behaviour and emotion. With an emphasis on a scientific approach which includes analysing quantitative data, neuropsychology follows an information processing approach to brain activity using standard assessments to evaluate various mental functions. This book examines the standardized battery of tests in neuropsychology with a particular focus on forensic applications of these tests, suggesting that a united theory of assessment needs to be established. Bringing together multiple articles related to forensic neuropsychology, this book offers an exploration of the neurological and psychometric theoretical basis for standardized batteries as well as a comparison between flexible and standardized batteries. Ultimately, it is argued that a standardized battery of tests need to be used and explains the justification for the reliability of this approach, especially in relation to expert witness testimony. While doing this, formal procedures including advanced mathematical procedures such as formulas and decision tree algorithms are presented to be utilized in assessments. With its thorough examination of the theoretical and practical applications of a standardized battery in neuropsychological assessment, this book will prove helpful to clinical practitioners and attorneys using assessment for their cases. Provides a unified theoretical basis for a standardized neuropsychological assessment battery. Shows the justification for using neuropsychological assessment in forensic applications. Offers practical examples which can be used to create a standardized assessment battery.

Integrated Management of Fruit Crops and Forest Nematodes Aurelio Ciancio, K.G. Mukerji, 2009-03-15 This series originated during a visit of prof K G Mukerji to the CNR Plant Protection Institute at Bari, Italy, in November 2005. Both editors convened to produce a series of five volumes focusing in a multidisciplinary approach on recent advances and achievements in the practice of crop protection and integrated pest and disease management. This fourth Volume deals with management of nematodes parasitic of tree crops and includes a section on tropical fruit crops and commodities as well as a second section on tree crops from more temperate areas. The latter also includes a chapter updating the current knowledge about the pine wood nematode *Bursaphelenchus xylophilus*. Volume 4 flanks Volume 2 of this IMPD series which focused on management of vegetable and grain crops nematodes. Nematodes are a very successful, diversified and specialised animal group present in nature in any ecological niche. Among nematode species, only a reduced number feeds on plants, of which a few species cause severe economic impacts on crop productions. Plant parasitic nematodes represent an important concern for a broad range of agricultural productions and systems worldwide. This statement explains the attention devoted in last decades to nematodes and the research and technical efforts invested for their control.
