Energy Savings Calculations for Commercial Building Energy Efficiency Upgrades Anthony J. Buonicore, 2024-07-02 Code compliant building materials and equipment will typically have a lower initial cost however the lifetime energy savings of the high efficiency equipment will often justify the upfront cost premium and result in a more cost effective solution Energy Savings Calculations for Commercial Building Energy Efficiency Upgrades assists energy professionals contractors building owners and managers in developing energy savings estimates that can facilitate a quick assessment of the potential energy

savings that might be realized when replacing existing building components with the highest efficiency equipment. It also provides algorithms to estimate greenhouse gas emission reductions that may be achieved by building energy efficiency upgrades and the impact these upgrades can have on building electrification decarbonization projects. This book focuses on the development of energy savings estimates based upon a whole building's energy consumption and the energy consumption associated with building end uses such as space heating, space cooling, ventilation, lighting, and so forth. Includes over 70 illustrative examples using algorithms to demonstrate how energy savings and greenhouse gas emission reductions may be estimated utilizing different strategies and equipment.

Modern HVAC Systems: A Training Module for Engineers Charles Nehme, In the ever evolving landscape of modern engineering the mastery of heating, ventilation and air conditioning HVAC systems is not merely a specialized skill but a foundational necessity. From the complex industrial facilities that power our economies to the intricate commercial and residential spaces where we live and work the performance of the built environment hinges critically on the efficiency, reliability and safety of its climate control systems. This training module is designed to bridge the gap between theoretical principles and practical application providing a robust in depth guide for engineers at all stages of their careers. My career spanning over three decades as a global HVAC and MEP consultant has afforded me a unique vantage point from which to observe and contribute to this vital field. I have witnessed firsthand the transformative power of innovative design and the critical importance of a deep nuanced understanding of the underlying physics and engineering principles. This book is the culmination of that experience distilled into a structured accessible format. It is intended to serve as more than just a textbook it is a resource for problem solving a reference for design and a guide for achieving optimal performance energy efficiency and indoor air quality in any project anywhere in the world. The chapters ahead are meticulously crafted to build knowledge progressively starting with the fundamental laws of thermodynamics and fluid mechanics before advancing to the complex interactions of system components and control strategies. We will explore the psychrometric chart not as a static tool but as a dynamic map of air properties that informs every design decision. We will demystify the refrigeration cycle and analyze its components in detail. My goal is to empower you the engineer with the comprehensive understanding needed to tackle the challenges of modern HVAC design with confidence and precision. This book is a testament to the belief that the best engineering solutions are born from a solid theoretical foundation combined with practical wisdom.
