Introduction to Mathematical Modeling and Chaotic Dynamics Ranjit Kumar

Upadhyay, Satteluri R. K. Iyengar, 2013-07-23 Introduction to Mathematical Modeling and Chaotic Dynamics focuses on mathematical models in natural systems particularly ecological systems Most of the models presented are solved using

MATLAB The book first covers the necessary mathematical preliminaries including testing of stability It then describes the modeling of systems from natural science focusing on one and two dimensional continuous and discrete time models Moving on to chaotic dynamics the authors discuss ways to study chaos types of chaos and methods for detecting chaos They also explore chaotic dynamics in single and multiple species systems The text concludes with a brief discussion on models of mechanical systems and electronic circuits Suitable for advanced undergraduate and graduate students this book provides a practical understanding of how the models are used in current natural science and engineering applications Along with a variety of exercises and solved examples the text presents all the fundamental concepts and mathematical skills needed to build models and perform analyses

Nonextensive Entropy Murray Gell-Mann, Constantino Tsallis, 2004-04-15 A great variety of complex phenomena in many scientific fields exhibit power law behavior reflecting a hierarchical or fractal structure Many of these phenomena seem to be susceptible to description using approaches drawn from thermodynamics or statistical mechanics particularly approaches involving the maximization of entropy and of Boltzmann Gibbs statistical mechanics and standard

laws in a natural way The book addresses the interdisciplinary applications of these ideas and also on various phenomena that could possibly be quantitatively describable in terms of these ideas

[Microscopic Chaos, Fractals and Transport in Nonequilibrium Statistical Mechanics](#) Rainer Klages, 2007 A valuable introduction for newcomers as well as an important reference and source of inspiration for established researchers this book provides an up to date summary of central topics in the field of nonequilibrium statistical mechanics and dynamical systems theory Understanding macroscopic properties of

matter starting from microscopic chaos in the equations of motion of single atoms or molecules is a key problem in nonequilibrium statistical mechanics. Of particular interest both for theory and applications are transport processes such as diffusion, reaction, conduction, and viscosity. Recent advances towards a deterministic theory of nonequilibrium statistical physics are summarized. Both Hamiltonian dynamical systems under nonequilibrium boundary conditions and non-Hamiltonian modelings of nonequilibrium steady states by using thermal reservoirs are considered. The surprising new results include transport coefficients that are fractal functions of control parameters, fundamental relations between transport coefficients and chaos quantities, and an understanding of nonequilibrium entropy production in terms of fractal measures and attractors. The theory is particularly useful for the description of many particle systems with properties in between conventional thermodynamics and nonlinear science as they are frequently encountered on nanoscales.
