      Robots, Drones, UAVs and UGVs for Operation and Maintenance Diego Galar,Uday Kumar,Dammika
Seneviratne,2020-05-07 Industrial assets such as railway lines roads pipelines are usually huge span long distances and can
be divided into clusters or segments that provide different levels of functionality subject to different loads degradations and
environmental conditions and their efficient management is necessary The aim of the book is to give comprehensive
understanding about the use of autonomous vehicles context of robotics for the utilization of inspection and maintenance
activities in industrial asset management in different accessibility and hazard levels The usability of deploying inspection
vehicles in an autonomous manner is explained with the emphasis on integrating the total process Key Features Aims for
solutions for maintenance and inspection problems provided by robotics drones unmanned air vehicles and unmanned
ground vehicles Discusses integration of autonomous vehicles for inspection and maintenance of industrial assets Covers the
industrial approach to inspection needs and presents what is needed from the infrastructure end Presents the requirements
for robot designers to design an autonomous inspection and maintenance system Includes practical case studies from
industries   *Selected papers from the 2nd International Symposium on UAVs, Reno, U.S.A. June 8-10, 2009* Kimon P.
Valavanis,Randal Beard,Paul Oh,Aníbal Ollero,Leslie A. Piegl,Hayong Shin,2011-04-11 In the last decade signi cant changes
have occurred in the eld of vehicle motion planning and for UAVs in particular UAV motion planning is especially dif cult due
to several complexities not considered by earlier planning strategies the creased importance of differential constraints
atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state
and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the
increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for
these problems and dif culty inherent in characterizing approximation algorithms makes it impractical to determine
algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical
characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is
dif cult to design a guidance system let alone choose the algorithm Throughout this paper we keep in mind some of the
general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration
constraints and potentially the higher order differential constraints associated with the equations of motion and the objective
is to guide the vehicle towards a goal through an obstacle eld A UAV guidance problem is typically characterized by a three
dimensional problem space limited information about the environment on board sensors with limited range speed and
acceleration constraints and uncertainty in vehicle state and sensor data   *Springer Handbook of Automation* Shimon Y.
Nof,2009-07-16 Automation is undergoing a major transformation in scope and dimension and plays an increasingly
important role in the global economy and in our daily lives Engineers combine automated devices with mathematical and
