Exploring the implementation of new types of materials in various sectors of automobile, aerospace, and structural engineering, the book provides applicable information on the behaviors of smart structures. The book provides a set of mathematical formulations to solve nonlinear static and dynamic behaviors of smart continuous structures by applying principles of elasticity. The book will interest academic researchers and graduate students studying structural engineering, mechanics of solids, and smart materials.

*Modeling and Analysis of Dynamic Systems* Charles M. Close, Dean K. Frederick, Jonathan C. Newell, 2001-08-20. The third edition of *Modeling and Analysis of Dynamic Systems* continues to present students with the methodology applicable to the modeling and analysis of a variety of dynamic systems regardless of their physical origin. It includes detailed modeling of mechanical, electrical, electro-mechanical, thermal, and fluid systems. Models are developed in the form of state variable equations, input-output differential equations, transfer functions, and block diagrams. The Laplace transform is used for analytical solutions. Computer solutions are based on MATLAB and Simulink. Examples include both linear and nonlinear systems. An introduction is given to the modeling and design tools for feedback control systems. The text offers considerable flexibility in the selection of material for a specific course. Students majoring in many different engineering disciplines have used the text. Such courses are frequently followed by control system design courses in the various disciplines.
