Elasticity and Geometry Basile Audoly, Yves Pomeau, 2010-06-24 We experience elasticity everywhere in daily life in the straightening or curling of hairs the irreversible deformations of car bodies after a crash or the bouncing of elastic balls in ping pong or soccer The theory of elasticity is essential to the recent developments of applied and fundamental science such as the bio mechanics of DNA filaments and other macro molecules and the animation of virtual characters in computer graphics and materials science In this book the emphasis is on the elasticity of thin bodies plates shells rods in connection with geometry It covers such topics as the mechanics of hairs curled and straight the buckling instabilities of stressed plates including folds and conical points appearing at larger stresses the geometric rigidity of elastic shells and the delamination of thin compressed films It applies general methods of classical analysis including advanced nonlinear aspects bifurcation theory boundary layer analysis to derive detailed fully explicit solutions to specific problems These theoretical concepts are discussed in connection with experiments Mathematical prerequisites are vector analysis and differential equations The book can serve as a concrete introduction to nonlinear methods in analysis

Groups, Combinatorics And Geometry Alexander Anatolievich Ivanov, Martin W Liebeck, Jan Saxl, 2003-03-19 Over the past 20 years the theory of groups in particular simple groups finite and algebraic has influenced a number of diverse areas of mathematics Such areas include topics where groups have been traditionally applied such as algebraic combinatorics finite geometries Galois theory and permutation groups as well as several more recent developments Among the latter are probabilistic and computational group theory the theory of algebraic groups over number fields and model theory in each of which there has been a major recent impetus provided by simple group theory In addition there is still great interest in local analysis in finite groups with substantial new input from methods of geometry and amalgams and particular emphasis on the revision project for the classification of finite simple groups This important book contains 20 survey articles covering many of the above developments It should prove invaluable for those working in the theory of groups and its applications

p -adic Geometry Matthew Baker, 2008 In recent decades p adic geometry and p adic cohomology theories have become indispensable tools in number theory algebraic geometry and the theory of automorphic representations The Arizona Winter School 2007 on which the current book is based was a unique opportunity to introduce graduate students to this subject Following invaluable introductions by John Tate and Vladimir Berkovich two pioneers of non archimedean geometry Brian Conrad s chapter introduces the general theory of Tate s rigid analytic spaces Raynaud s view of them as the generic fibers of formal schemes and Berkovich spaces Samit Dasgupta and Jeremy Teitelbaum discuss the p adic upper half plane as an example of a rigid analytic space and give applications to number theory modular forms and the p adic Langlands program Matthew Baker offers a detailed discussion of the Berkovich projective line and p adic potential theory on that and more general Berkovich curves Finally Kiran Kedlaya discusses theoretical and computational aspects of p adic cohomology and the zeta functions of varieties This book will be a welcome

addition to the library of any graduate student and researcher who is interested in learning about the techniques of p adic geometry

Selectivity in Chemical Reactions J.C. Whitehead, 1988-10-31 The aim of this Workshop on Selectivity in Chemical Reactions was to examine the specific preferences exhibited by simple chemical

reactions with regards to reagents having particular energy states symmetries alignment and orientation and the resulting formation of certain products with their corresponding energies states alignment and polarisation Such problems come close to the ultimate goal of reaction dynamics of being able to determine experimentally and theoretically state to state cross sections and stereochemical effects under well defined and characterised conditions There are many examples of highly selective and specific processes to be found in atmospheric and combustion chemistry and the production of population inversions amongst vibrational and electronic states lies at the heart of the development of chemical laser systems Only when we can understand the fundamental processes that underlie the selectivity in the formation of products in a chemical reaction and the specific requirements of initial states of the reagents can we expect to be able to develop the explanatory and predictive tools necessary to apply the subject to the development of new laser systems efficient combustion schemes and specific methods of chemical synthesis to the control of atmospheric pollution and to all problems in which it is necessary to direct the outcome of a chemical reaction in a specific way The brief given to the Workshop was to critically review the field to discuss the present limitations and difficulties and to identify new directions Documents of the ...
