G. Clark Davenport, 2017-06-26 Remote Sensing Technology in Forensic Investigations provides a basic understanding of concepts involved in the use of basic geophysical surveying metal detectors magnetics electromagnetics and ground penetrating radar in police and forensic investigations Such technology can be vital in locating clandestine buried evidence which is often concealed in the subsurface underground Crime scene investigation and evidence collection entails locating

identifying collecting and cataloging Such physical evidence searches are time consuming and can often lead to searches that require excavations which in itself that can destroy evidence The noninvasive nondestructive methods outlined in this book can both reduce the time spent on searches and excavations thereby increasing the probability of locating vital physical evidence As such the application of remote sensing methods has gained increased acceptance and seen increased usage by investigators Remote sensing methods are based on making indirect measurements of the surface of and within the earth The resulting measurement information can be presented in either an imaging format such as in aerial photography or a non imaging format such as in a profile or contour map These measurements can be interpreted to identify and characterize contrasts due to differences in physical and natural properties of the materials being studied This can include physical evidence remains and clandestine graves This book will serve as a handy introductory primer to the technology techniques and application of such techniques Throughout numerous references and additional resources are provided for those investigators forensic anthropology and police professionals who want further information on the technology s usage for investigative purposes

**CRREL Report** ,1950 **Evaluation of the Magnetic Induction Conductivity Method for Detecting Frazil Ice Deposits** ,1987 The ability to map frazil ice deposits and water channels beneath an ice covered river in central Alaska using the magnetic induction conductivity MI technique has been assessed The study was performed during the first week of March of 1986 on the Tanana River near Fairbanks and employed a commercially available instrument operating at a fixed frequency with a fixed antenna coil spacing and orientation Comparisons of the MI data with theoretical models based upon physical data measured along three cross sections of the river demonstrate the sensitivity of the MI technique to frazil ice deposits The conductivity generally derived for the frazil ice deposits encountered is very low approx 00063 s m when compared with the measured value for water approx 0 011 S m and is similar to the calculated values for gravel and sandy gravel bed sediments In all three cross sections maxima in the apparent conductivity profiles correlated with frazil ice deposits Difficulties possibly due to adverse effects of cold weather upon instrument calibration affected the quantitative performance of the instrument on one cross section although the interpretation of the data locations of open channels vs frazil deposits was qualitatively unaffected Keywords Resistivity surveying
