Reference range values are for apparently healthy people and often overlap significantly with values for those who are sick. Actual values may vary significantly due to differences in assay methodologies and standardization. Institutions may also set up their own reference ranges based on the particular populations that they serve, thus regional differences may occur. Consequently, values reported by individual laboratories may differ from those listed in this appendix.

All values are given in conventional and SI units. However, in cases where SI units have not been widely accepted, conventional units are used. In case of the heterogeneous nature of the materials measured or uncertainty about the exact molecular weight of the compounds, SI measurements cannot be used so that mass per volume remains as the unit of concentration.
