immunoregulation has paved the way to better prevent or control transplantation rejection. However, such mechanisms underlying immune dysregulation are highly variable depending on the type of pathology: systemic chronic inflammatory diseases, autoinflammatory diseases, autoimmune disorders, immunosuppression, and on characteristics of the host such as sex, genetics, nutritional status, etc. Given the wide variety of pathologies that are a consequence of excessive, inefficient, or inadequate induction of immune responses, the study of factors involved in the dysregulation of the immune system has gained great attention during the last decades.
