BEAM FIRE DETECTOR USE AND UCL BUILDING LOCATIONS

USE OF BEAM DETECTORS

Beam Smoke Detection - Beam Detection is used where situations that the installation, testing, and maintenance of point type detectors is difficult. For example, in spaces with high ceilings, once construction has been completed and the space is occupied, it is often difficult to reach the ceiling without the use of heavy, cumbersome lifts operations or where that there are large open expanses etc.

UCL use the optical reflective beam smoke detector unit and reflective mirror type as per the picture.

The Optical Reflective Beam Smoke Detectors

Beam Smoke Detector works on the principle of light obscuration. The photosensitive element of the Optical Beam Smoke Detector sees light produced by the Transmitter (TR) in a normal condition and uses a reflective mirror to return the light beam back to the transmitter. Any obscuration of the beam detector including smoke, objects (poles, helium filled balloons poles brushes or persons) will imitate a fire signal and place the premises into full fire evacuation.

Any object other than smoke will set the beam detector off passing through the beam.

Procedure For Working by Beam Detectors

Design Consultants, Consultants, UCL Project Managers and Contractors please note that a **'Permit to Work'** on fire alarm systems is required to prevent the unwanted automatic calling of the fire brigade when working at height or in the vicinity of beam detectors - your will require a **Permit (requiring 72 Hours Notice)** to be issued and instruction to isolate the beam detectors during the day time only by an approved Project Manager. Consultation with Fisk Fire Group & UCL Maintenance Engineers before commencing general or construction work will be necessary

Welcome to the path of enhanced fire safety and knowledge

Let s begin exploring the world of fire detection systems

Ionization smoke detectors are a type of smoke detector that use ionization technology to detect the presence of smoke in the air

Here s a detailed overview

How Ionization Smoke Detectors Work

Radioactive Material Ionization smoke detectors contain a small amount of radioactive material typically americium 241

This radioactive material ionizes the air in a small chamber within the detector

Ionization Process The americium 241 emits alpha particles which collide with air molecules creating ions charged particles

This process generates a small steady electrical current within the chamber as the ions move between two charged plates

Disruption by Smoke When smoke enters the ionization chamber it attaches to the ions disrupting the flow of electrical current

The reduction in current flow is detected by the circuitry within the smoke detector

Alarm Activation The decrease in current flow triggers the alarm alerting occupants to the presence of smoke and potential fire

Characteristics and Advantages

Sensitivity to Fast Flaming Fires Ionization smoke detectors are particularly responsive to fast flaming fires that produce small invisible combustion particles

These fires often spread rapidly and can be detected quickly by ionization detectors

Cost Effective Generally ionization smoke detectors are less expensive than photoelectric smoke detectors

Widespread Use They are widely used and can be found in many homes and commercial buildings

Limitations

False Alarms Ionization smoke detectors are more prone to false alarms caused by cooking fumes or steam

Less Effective for Smoldering Fires They are less sensitive to slow smoldering fires that produce larger smoke particles

For these types of fires photoelectric smoke detectors are more effective

Radioactive Material Although the amount of radioactive material used is very small and poses minimal health risk some people may prefer to avoid products containing radioactive substances

Installation and Maintenance

Placement Install ionization smoke detectors on every level of the home inside each bedroom and outside sleeping areas

They should be placed on the ceiling or high on the wall

Regular Testing Test the detectors monthly to ensure they are working properly

Most units have a test button that can be pressed to check the alarm

Battery

Replacement Replace the batteries at least once a year or whenever the low battery warning sounds Some newer models come with long life batteries that last up to 10 years Replacement of Units Replace the entire smoke detector unit every 8 10 years as sensors and electronic components degrade over time Combination Detectors Many modern smoke detectors combine both ionization and photoelectric sensors to provide comprehensive protection against both fast flaming and smoldering fires These dual sensor detectors can offer enhanced safety and help reduce the likelihood of false alarms Summary Ionization smoke detectors are an effective and affordable solution for detecting fast flaming fires However for optimal fire protection especially in residential settings it s often recommended to use a combination of ionization and photoelectric smoke detectors or dual sensor units Regular maintenance and proper placement are key to ensuring these devices function correctly and provide early warning in the event of a fire
