For the design the construction of highway and airfield, it is imperative to carry out tests on construction materials for their scientific designing and cost-minimum. The inherent economy in construction depends upon the maximum use of local materials. The prime objective of the different tests is to know and classify the processed material into different group depending upon their physical and strength or stability characteristics.

Different types of permeants are investigated, all made for the sole and immediate convenience of various types of industries in the chemical world. In these permeants are laid over a prepared soil surface sealed with asphalt. It is necessary first to test the properties of the asphaltic soil and to establish its properties in respect to the various moisture conditions, before taking up the design and construction of the permeant. The basic tests needed on the asphaltic soil for this purpose are for the classification and identification of the soil, its density and composition characteristics. It is also necessary to determine the strength characteristics of the asphaltic soil for the design of permeants. Some of the important tests on asphaltic soil are given in Part II of this book.

Parameters are classified into two major groups as *facilitative* and *rigid*. The parameter sections which do not fall in any one of these types, are being classified as *semi-rigid* or *semi-facilitative*. Depending upon the technique and the material of construction, the parameters are divided into three broad categories: (a) *Structural* (fill, concrete, cement, and steel), (b) *Geotechnical* (soil, rock, and aggregate), and (c) *Behavioral* (fill, concrete, cement, and steel). The study of road stones are judged by studying their resistance against abrasion, crushing, and weathering action. The other properties of aggregate which are important are their shape factor, specific gravity, water absorption, relative efficiency with bitumen, etc. The important tests on aggregate for use as pavement material have been presented in Part II of this book.

[illegible]

Interimment systems are used in the traffic course of pavements, some types of Interimment system are also used in the base course of some flexible pavements. These paving systems are to be designed to withstand the varying conditions of climate and traffic. There are several methods of Interimment mix design. Two of the more common methods are given in Part IV of the book.

There are several good and useful sources listed and not included as these are continuously dealt within current technology through more standard publications.

Values of the tests are listed, respectively, for the various materials and are presented in different columns for different apparatus/instruments. The test methods used and equipment used in this study are listed in the notes given by the Indian Standards Committee (1970) and the Indian Bureau of Standards (1970) in the case of tests not covered by the ISI or BSI, the specifications and nomenclatures of other standard organizations (like the British Standards Institution, American Society for Testing Materials, Applied Mechanics, etc.) have been followed.

Preface to the first edition

Different educational institutions in India have now developed their syllabi wherein testing of highway materials have been included. Hence an urgent need of suitable laboratory manual has been felt. This book though particularly designed for engineering students, deals with the routine tests that the field engineers engaged in paving jobs may also need to know too.

In preparing this manual, authors have extensively used the publications of ICA, ILO, AETM, and Alpha Institute. The help received from these organizations is therefore gratefully acknowledged here.

Industry 5.0 and Paradigm Shift—Emerging Challenges

Namit Gupta, Roopa Shinde, Rakesh Kumar Malviya, Anjali Gupta, 2023-01-23 Industry 5.0 is the successor of the Industry 4.0 concept which employed high technology in the manufacturing industry Industry 5.0 is a new idea that adds a human touch to the work of robots and smart machines The basic idea of humans and machines working together is to increase efficiency and effectivity like the Internet of things IoT It aims to merge the increasing cognitive computing abilities of the robots with the intelligence and resourcefulness of the humans The progress of Industry 5.0 is inevitable As the technology grows more each day we find ways to make our work simpler The development of such technologies to make the world more efficient requires its manufacturers i.e humans who collaborate with these machines and technologies Humans are indispensable resources as what a machine can do is limited And with all these efficiencies we have come so far there is no path leading us back With adoption of new concepts comes a paradigm shift as development continues and we move from Industry 4.0 which speaks of the future of production its primary purpose continues to be achieving seamless connectivity between machines and IT systems for higher productivity and efficiencies across the value chain Overall it focuses mainly on traditional financial and operational KPIs Whereas Industry 5.0 gives a human touch to the concept of 4.0 keeping in mind the well being of the environment and society making the machines and humans work together on a path of Green Future Industry 5.0 has the balance of both humans and technologies which benefits the ecosystem with discovery of new energy sources and renewable resources helping in a sustainable working environment It can be used to reduce harmful residue caused due to manufacturing processes and recycle rare materials Taking this theme the multidisciplinary congress on Industry 5.0 and Paradigm Shift Emerging Challenges will highlight research challenges and open issues that should be further developed to realize Industry 5.0
