Natural Selection

- 1. What is evolution?
- 1. Evolution is any change in the heritable traits within a population across generations.
- 2. Was Charles Darwin the first person to talk about evolution?
- 2. No.
- 3. Was Charles Durwin a laboratory scientist?
- 3. No, he was a naturalist.
- 4. What is a naturalist?
- 4. A naturalist is a person who studies the natural world, including plants, animals, and rock formations.
- 5. How long did Darwin spend on the HMS Beagle as a naturalist?
- Darwin spent five years as a naturalist aboard the HMS Beagle.
- 6. What was the purpose of the Beagle's voyage?
- The Beagle traveled to South America and its remote islands to make navigational maps.
- 7. What did Durwin do when he visited South America and the Galapagos Islands?
- Darwin made observations and detailed notes of the biology and geology of the locations he visited.
- 8. What does diversity mean?
- 8. Diversity means "being different from others" or "variety."
- 9. What did Durwin compare?
- Durwin compared the similarities and differences among the animals and fossils of animals from the different islands be visited.
- 10. What did Durwin reason from his observations of differences among organisms on the South American mainland and the Galápagos Islands?
- Darwin reasoned that animals and plants on the Galāpagos Islands originally came from South America, and, over time, they evolved to become different.
- 11. How do the two types of tortoises Darwin observed on the Galāpagos Islands support the concept of evolution?
- 11. The tortoises that lived on islands where their food was low-growing plants had short necks and dome-shaped shells. Those living on islands where the food was high-growing cacti had long front legs, long necks, and saddle-shaped shells that made it easier for tortoises to stretch vertically to reach food. Over time, tortoises had evolved so that their neck and shell types best suited their islands' food sources.
- 12. What kind of bird and what trait of that bird did Darwin study on the Galapagos Islands?
- Darwin studied finches and their beak size and shape.
- 13. What are finch beak size and shape related to?
- 13. Beak size and shape are related to the food the finch eats and where it must go to get the food.
- 14. Why are the finch species in the Galápagos Islands different from each other, even though they all descended from a common ancestor?
- 14. The finches are different, or evolved, because they became suited to the different habitats on the islands. The changes occurred through the process of natural selection as a result of different environments on each island.
- 15. What is selective breeding?
- 15. Selective breeding is breeding plants or animals to get offspring with specific desired characteristics.
- 16. Does selective breeding create new species?
- 16. No, selective breeding does not create new species.
- 17. How does a trait that helps organisms survive become more common among members of a species?
- 17. Organisms with a trait that helps them survive produce more offspring than members of their species that do not have the helpful trait.
- 18. Why is genetic variation necessary for evolution to occur?
- 18. Genetic variation results in organism's traits being different. Those differences result in some organisms being better able to survive and reproduce; their relative numbers within a population of organisms increase. The makeup of the population changes. That is evolution.
