The Polarization Method of Seismic Exploration E.I. Galperin, 2012-12-06 variegated seismological conditions has been accumulated The method has been developed further in two main directions the perfection of the techniques and equipment of three component field studies incorporating a continuous control of the identity of equipment both in deep boreholes and on the surface the creation of efficient and straightforward software for the automatic processing of PM data Whereas the early stages of development of the method have been conspicuous chiefly by the use of polarization for the discrimination of the wave field in recent years the emphasis shifts to the use of polarization parameters to obtain additional information about the Earth This is especially important as the polarization parameters are very sensitive to inhomogeneities in cross section and enable those parameters of the Earth to be studied which cannot be obtained from kinematics Here one should especially mention the polarization of transverse waves which can act as one of the most reliable parameters for identifying and studying anisotropic properties of the Earth At present various modifications of PM are being developed applicable both to uphole PM RW reflected waves method PM CDP common depth point method PM refracted wave method PM of regional studies utilizing earthquakes and to downhole observations PM VSP vertical seismic profiling Not all the PM modifications are developing at the same rate The method which has up to now been developed most extensively is PM VSP **Data**
