Introduction

When a bar magnet is moved back and forth through a coil of wire, a current is induced in the coil. This is called electromagnetic induction. The induced current can be detected by a galvanometer. The induced current can also be used to power a small motor. This is called an electric generator.

The direction of the induced current can be determined by using the right-hand rule. The induced current will flow in a direction that opposes the change in magnetic flux. This is called Lenz's law.

The induced current can also be used to power a small motor. This is called an electric generator. The induced current can also be used to power a small motor. This is called an electric generator.

Procedure

Part 1: Induction

Step 1: Turn the bar magnet into the coil of wire. Observe the deflection of the galvanometer. Repeat the experiment with the magnet moved out of the coil. Observe the deflection of the galvanometer.

Step 2: Repeat the experiment with the magnet moved into the coil. Observe the deflection of the galvanometer. Repeat the experiment with the magnet moved out of the coil. Observe the deflection of the galvanometer.
