Schütze, David Butler, Bruce M. Beck, 2002-02-20 by Professor Poul Harremoes Environmental engineering has been a discipline dominated by empirical approaches to engineering Historically speaking the development of urban drainage structures was very successful on the basis of pure empiricism Just think of the impressive structures built by the Romans long before the discipline of hydraulics came into being The fact is that the Romans did not know much about the theories of hydraulics which were discovered as late as the mid 1800s However with the Renaissance came a new era Astronomy Galileos and basic physics Newton started the scientific revolution and in the mid 1800s Navier and Stokes developed the application of Newtons laws to hydrodynamics and later St Venant the first basic physics description of the motion of water in open channels The combination of basic physical understanding of the phenomena involved in the flow of water in pipes and the experience gained by trial and error the engineering approach to urban drainage improved the design and performance of the engineering drainage infrastructure However due to the mathematical complications of the basic equations solutions were available only to quite simple cases of practical significance until the introduction of new principles of calculation made possible by computers and their ability to crunch numbers Now even intricate hydraulic phenomena can be simulated with a reasonable degree of confidence that the simulations are in agreement with performance in practice if the models are adequately calibrated with sample performance data

Stochastic Flood Forecasting System Renata J. Romanowicz, Marzena Osuch, 2015-06-29 This book presents the novel formulation and development of a Stochastic Flood Forecasting System using the Middle River Vistula basin in Poland as a case study The system has a modular structure including models describing the rainfall runoff and snow melt processes for tributary catchments and the transformation of a flood wave within the reach The sensitivity and uncertainty analysis of the elements of the study system are performed at both the calibration and verification stages The spatial and temporal variability of catchment land use and river flow regime based on analytical studies and measurements is presented A lumped parameter approximation to the distributed modelling of river flow is developed for the purpose of flow forecasting Control System based emulators Hammerstein Wiener models are applied to on line data assimilation Medium range probabilistic weather forecasts ECMWF and on line observations of temperature precipitation and water levels are used to prolong the forecast lead time The potential end users will also benefit from a description of social vulnerability to natural hazards in the study area
