Prospects and Applications for Plant-Associated Microbes, A laboratory manual Anna Maria Pirttilä, Seppo Sorvari, 2014-12-15 Plant associated microbes are ubiquitous organisms living in a range of interactions with their host Involving two organisms research and applications of plant microbes are challenging and often require specific skills This book guides the reader in the world of plant associated fungi giving both theoretical and practical insight on the potential of this interaction in biotechnology Detailed instructions and step by step protocols are described for isolation identification localization and community analysis of fungi studies on their bioactivity molecular plant fungal interactions and development of fungi as tools for biotechnology *The Handbook of Plant Functional Genomics* Guenter Kahl, Khalid Meksem, 2008-07-21 In this incisive concise overview of this booming field the editors two of the leading figures in the field with a proven track record combine their expertise to provide an invaluable reference on the topic Following a treatment of transcriptome analysis the book goes on to discuss replacement and mutation analysis gene silencing and computational analysis The whole is rounded off with a look at emerging technologies Each chapter is accompanied by a concise overview helping readers to quickly identify topics of interest while important carefully selected words and concepts are explained in a handy glossary Equally accessible to both experienced scientists and newcomers to the field **R-Loops** Andrés Aguilera, Alexey Ruzov, 2022-06-15 This detailed book compiles a series of laboratory protocols covering the most important aspects of R loop biology Beginning with a range of methods allowing for the detection of DNA RNA hybrids as well as their purification and visualization by electron microscopy the volume continues with methods based on the use of RNase H derived tools to detect DNA RNA hybrids in vitro and in vivo Several protocols permit studying non canonical RNA nucleotides in the R loop context as well as a number of specific protocols devoted to the investigation of R loop topology and their functional roles in the biology of mitochondria and telomeres Finally a large block of chapters is dedicated to different methods allowing genome wide mapping of DNA RNA hybrids in various organisms Written for the highly successful *Methods in Molecular Biology* series chapters include introductions to their respective topics lists of the necessary materials and reagents step by step readily reproducible laboratory protocols and tips on troubleshooting and avoiding known pitfalls Authoritative and practical *R Loops Methods and Protocols* serves as an ideal resource for those working on R loop homeostasis but also to scientists studying such areas of molecular and cell biology as genome integrity DNA replication and repair chromatin remodeling transcription RNA processing modification and export as well as for researchers elucidating the molecular mechanisms of cancer and genetic diseases **Characterization of novel viruses in deciduous tree species in forests and public green spaces - case studies in Quercus robur and Fraxinus excelsior (Band 60)** Marius Rehanek, The health of plants in general and deciduous trees in particular is influenced by a variety of factors including abiotic and biotic factors Uncountable harmful organisms can lead to a weakening of deciduous trees and shrubs in forests and urban green which are

worth protecting due to their longevity and the invaluable ecosystem services they provide as well as their high economic value. In this context, plant viruses play a major role and must be considered. Due to their ability to affect the host metabolism for the purpose of their own replication, they can influence the vitality of trees, change their susceptibility to other stress factors, and thus lead to economic and ecological losses. In recent years, established technologies in the field of sequencing and bioinformatics have revealed the high abundance and enormous diversity of viruses in forest trees. New viruses of the genus Emaravirus have been discovered in numerous hosts, including herbaceous and woody plants. Especially in deciduous trees, emaraviruses have become the most widespread virus group, causing diseases in important species of temperate and boreal forests. In this doctoral thesis, genetic and biological aspects of novel viruses were studied with special focus on the emerging group of emaraviruses. Using the case studies common oak *Quercus robur* L. and common ash *Fraxinus excelsior* L., epidemiological studies revealed a wide distribution of common oak ringspot associated virus CORaV and ash shoestring associated virus ASaV in forest and urban trees. CORaV and ASaV can be differentiated from other pathogens based on specific leaf symptoms. With the help of a newly developed diagnostic ELISA, CORaV can be reliably detected serologically in diseased oak trees. A new species of rust mite is likely to be the vector for virus transmission. Based on the results, considering the composition of emaraviral accessory proteins, the taxonomic order of the genus Emaravirus can be revised. In addition to ASaV, cytorhabdoviruses were shown to frequently infect common ash in natural and managed forest sites. Genetic characterization provided evidence for two distinct cytorhabdovirus species affecting not only *Fraxinus excelsior* but also manna ash *Fraxinus ornus* and red ash *Fraxinus pennsylvanica*. Applying high-throughput sequencing (HTS) analyses, sequence information about novel viruses belonging to different families has been revealed. The doctoral thesis provides new insights into the diverse virome of deciduous trees, thereby highlighting the demand for further studies on this fascinating group of pathogens. Their characterization and interaction with other abiotic and biotic stressors may serve as a basis for better disease management concepts of essential long-living trees in the future.
