De-la-Peña,Raúl Alvarez-Venegas,Christopher Cullis,2016-05-31 Epigenetics is a new field that explains gene expression at the chromatin structure and organization level Three principal epigenetic mechanisms are known and hundreds of combinations among them can develop different phenotypic characteristics DNA methylation histone modifications and small RNAs have been identified and their functions are being studied in order to understand the mechanisms of interaction and regulation among the different biological processes in plants Although fundamental epigenetic mechanisms in crop plants are beginning to be elucidated the comprehension of the different epigenetic mechanisms by which plant gene regulation and phenotype are modified is a major topic to develop in the near future in order to increase crop productivity Thus the importance of epigenetics in improving crop productivity is undoubtedly growing Current research on epigenetics suggest that DNA methylation histone modifications and small RNAs are involved in almost every aspect of plant life including agronomically important traits such as flowering time fruit development responses to environmental factors defense response and plant growth The aim of this Research Topic is to explore the recent advances concerning the role of epigenetics in crop biotechnology as well as to enhance and promote interactions among high quality researchers from different disciplines such as genetics cell biology pathology microbiology and evolutionary biology in order to join forces and decipher the epigenetic mechanisms in crop productivity      **Abiotic Stress Alleviation in Plants: Morpho-Physiological and Molecular Aspects** Diaa Abd El Moneim,Mehdi Rahimi,Mahmoud Magdy,Mohammad Golam Mostofa,2023-10-27 Plants are constantly exposed to changing environmental conditions Abiotic stresses cause adverse effects on plant growth development survival and yield It is essential to improve plant responses to such environmental conditions to achieve sustainable crop growth development and productivity The activation of plant stress signaling mechanisms is crucial to address the adverse impacts of environmental factors on plant growth and productivity Phytoprotectants including signaling molecules play crucial roles in the activation of plant physiological and molecular mechanisms to withstand the negative effects of abiotic stress on plants Investigation of physiological biochemical and metabolic pathways associated with plant adaptation to abiotic stress will help identify the key players involved in plant abiotic stress tolerance mechanisms The sensing signaling and gene regulatory mechanisms that help plants cope with abiotic stress must be fully explored      *Radiation Therapy Dosimetry* Arash Darafsheh,2021-03-08 This comprehensive book covers the everyday use and underlying principles of radiation dosimeters used in radiation oncology clinics It provides an up to date reference spanning the full range of current modalities with emphasis on practical know how The main audience is medical physicists radiation oncology physics residents and medical physics graduate students The reader gains the necessary tools for determining which detector is best for a given application

change in their growth performance Scientists are facing the challenging task of producing 70% more food to feed an additional 2.3 billion people by 2050 Therefore it is imperative to develop stress resilient crops with better yields under drought and salt stress to meet the food requirements of upcoming generations Drought and salinity have significant inhibitory impacts on cellular redox regulation with remodelled plant architecture Salinity hampers plant growth in two phases the first phase leads to plant growth suppression due to the osmotic effect of ions present in soil solution and the second phase leads to growth inhibition caused by ion toxicity due to the uptake and accumulation of specific ions The first phase of salt stress is very similar to that of drought stress However growth under salinity is restricted primarily by osmotic stress Thus creating drought resistant tolerant species would produce plants well suited to a saline environment As salinity in its first phase of salt stress is much like that of drought stress common responses to salinity and drought stresses are expected This Research Topic explores both the common and distinct responses of plants under salinity and drought which modify plant growth and adaptation Furthermore it will seek to understand the biochemical physiological and genetic mechanisms which are critical for improving plant tolerance to these environmental stresses In recent years due to the advancement in omics and breeding technologies significant progress has been made in this direction but knowledge gaps still exist The efforts in translating the knowledge gained through basic research should be expedited to achieve the desired outcomes of enhancing crop productivity and ensuring global food and nutritional security To ensure the focus remains on impactful applied research we will not be accepting submissions that are purely descriptive in nature We will include contributions on themes such as Mechanistic insights into plant responses to drought and salinity Understanding of the ROS regulation under salinity and drought stress Tools or resources for engineering drought and salt resistant crops Plant breeding towards stress tolerant crop varieties by developing molecular markers and high throughput approaches The role of signal transduction and signaling cascades in response to drought and salinity The use of multi omics approaches to provide insights into traits defining stress tolerance for crop improvement Physiological molecular and genetic mechanisms underlying adaptation of agronomically important crops to abiotic stresses Functional validation and physiological insights of key genes and proteins involved in stress tolerance Advancement in transcriptomic metabolomic proteomic and genomic integrated breeding approaches for enhancing stress tolerance The introduction of new breeding methods to accelerate the rate of genetic gain for sustainable agriculture while maintaining other core traits

Applicative and Ecological Aspects of Mycorrhizal Symbioses Mustafa Morsy, Sunil Mundra, 2024-11-22 Mycorrhizal symbioses a mutual association between plants and fungi plays a vital role in shaping and balancing the ecosystem of our planet Approximately 80% of vascular plant species form mycorrhizal associations between their roots and soil borne fungi Moreover such association between plants and mycorrhizal fungi drastically affect the water and nutrient absorption by plant roots as well as provides protection against soil borne pathogens Hence mycorrhizal symbioses might be advantageous for plants and our ecosystem under the

drastically changing climate which is threatening and distorting our ecosystem Threats to our ecosystem should therefore encourage investigations and inventories of mycorrhizal diversity function and their application Although numerous research has been done in this area some issues remain unsolved because of the dramatic diversity of mycorrhizal associations along with their specificity in response to host plants especially under different climate and soil conditions in different ecosystems Therefore the collection under this research topic aim to provide up to date applicative thorough studies on mycorrhizal symbioses through ecological perspective For this Research Topic we welcome both reviews and original articles that address the following research agenda but not limited to the diversity structure and function of mycorrhizal fungi associated with plants trees crops in different ecosystems the impacts of mycorrhizae on plant species under different environmental condition i e warmer climate drought the interaction between mycorrhizal fungi and plant species in soil with different water level nutrients and salinity the application of the mycorrhizae on regeneration and dynamics of ecosystems as well as their biomass production

*Enhancing Sustainable Crop Production: Biostimulants and Biotechnological Approaches in Challenging Climates* Günter Neumann, Fahim Nawaz, Markus Weinmann, Vicent Arbona, Raffaella Balestrini, Chiara Pagliarani, Miguel Gonzalez-Guzman, 2025-01-07 In the face of climate change agricultural and horticultural systems are encountering challenges related to resource availability agrochemical restrictions and production costs The use of biostimulants as plant strengtheners and green biotechnological strategies offers potential solutions However there are limitations to their field application making it crucial to bridge the gap between lab research and practical implementation Meanwhile the need for safe and environmentally friendly practices to ensure sustainable food production in challenging climates is growing This Research Topic aims to explore the field application of biostimulants and novel biotechnological approaches for enhancing crop productivity and stress tolerance We invite authors to submit research papers on the application of biostimulants in cropping systems under field conditions including arable and permanent crops

[Harnessing Useful Rhizosphere Microorganisms for Pathogen and Pest Biocontrol, Volume II](#) Aurelio Ciancio, Corné M. J. Pieterse, Jesús Mercado-Blanco, 2019-11-28 The use of biocontrol agents and beneficial organisms for management of plant and pest diseases appears as an environment friendly and economic procedure However this option is not always available depending on the lack of knowledge on the mechanisms of natural regulation locally effective In this view this eBook considers studies and experimental works illustrating a range of problems and solutions based on microbial resources suitable for management of biotic stress factors These examples show how detailed data and knowledge on the organisms involved are of paramount importance to achieve a sustainable and durable management capability
