Venkateshan, Prasanna Swaminathan, 2023-05-31 The book is designed to serve as a textbook for courses offered to graduate and upper undergraduate students enrolled in mechanical engineering The book attempts to make students with mathematical backgrounds comfortable with numerical methods The book also serves as a handy reference for practicing engineers who are interested in applications The book is written in an easy to understand manner with the essence of each numerical method clearly stated This makes it easy for professional engineers students and early career researchers to follow the material presented in the book The structure of the book has been modeled accordingly It is divided into four modules i solution of a system of equations and eigenvalues which includes linear equations determining eigenvalues and solution of nonlinear equations ii function approximations interpolation data fit numerical differentiation and numerical integration iii solution of ordinary differential equations initial value problems and boundary value problems and iv solution of partial differential equations parabolic elliptic and hyperbolic PDEs Each section of the book includes exercises to reinforce the concepts and problems have been added at the end of each chapter Exercise problems may be solved by using computational tools such as scientific calculators spreadsheet programs and MATLAB codes The detailed coverage and pedagogical tools make this an ideal textbook for students early career researchers and professionals

Introduction To Computational Neurobiology And Clustering Brunello Tirozzi, Daniela Bianchi, Enrico Ferraro, 2007-06-12 This volume provides students with the necessary tools to better understand the fields of neurobiological modeling cluster analysis of proteins and genes The theory is explained starting from the beginning and in the most elementary terms there are many exercises solved and not useful for the understanding of the theory The exercises are specially adapted for training and many useful Matlab programs are included easily understood and generalizable to more complex situations This self contained text is particularly suitable for an undergraduate course of biology and biotechnology New results are also provided for researchers such as the description and applications of the Kohonen neural networks to gene classification and protein classification with back propagation neural networks

Engineering Dynamics 2.0 Lester W. Schmerr, 2019-01-10 This book presents a new approach to learning the dynamics

of particles and rigid bodies at an intermediate to advanced level There are three distinguishing features of this approach First the primary emphasis is to obtain the equations of motion of dynamical systems and to solve them numerically As a consequence most of the analytical exercises and homework found in traditional dynamics texts written at this level are replaced by MATLAB based simulations Second extensive use is made of matrices Matrices are essential to define the important role that constraints have on the behavior of dynamical systems Matrices are also key elements in many of the software tools that engineers use to solve more complex and practical dynamics problems such as in the multi body codes used for analyzing mechanical aerospace and biomechanics systems The third and feature is the use of a combination of Newton Euler and Lagrangian analytical mechanics treatments for solving dynamics problems Rather than discussing these two treatments separately Engineering Dynamics 2 0 uses a geometrical approach that ties these two treatments together leading to a more transparent description of difficult concepts such as virtual displacements Some important highlights of the book include Extensive discussion of the role of constraints in formulating and solving dynamics problems Implementation of a highly unified approach to dynamics in a simple context suitable for a second level course Descriptions of non linear phenomena such as parametric resonances and chaotic behavior A treatment of both dynamic and static stability Overviews of the numerical methods ordinary differential equation solvers Newton Raphson method needed to solve dynamics problems An introduction to the dynamics of deformable bodies and the use of finite difference and finite element methods Engineering Dynamics 2 0 provides a unique modern treatment of dynamics problems that is directly useful in advanced engineering applications It is a valuable resource for undergraduate and graduate students and for practicing engineers
