Kidd,2012-12-06 Building an expert system involves

eliciting analyzing and interpreting the knowledge that a human expert uses when solving problems Experience has shown that this process of knowledge acquisition is both difficult and time consuming and is often a major bottleneck in the production of expert systems Unfortunately an adequate theoretical basis for knowledge acquisition has not yet been established This requires a classification of knowledge domains and problem solving tasks and an improved understanding of the relationship between knowledge structures in human and machine In the meantime expert system builders need access to information about the techniques currently being employed and their effectiveness in different applications The aim of this book therefore is to draw on the experience of AI scientists cognitive psychologists and knowledge engineers in discussing particular acquisition techniques and providing practical advice on their application Each chapter provides a detailed description of a particular technique or methodology applied within a selected task domain The relative strengths and weaknesses of the technique are summarized at the end of each chapter with some suggested guidelines for its use We hope that this book will not only serve as a practical handbook for expert system builders but also be of interest to AI and cognitive scientists who are seeking to develop a theory of knowledge acquisition for expert systems More Trouble with Maths
