

## Activity 10.1

Reading material on our website on genetic variation in gametes completes part 1 of the following questions. Read carefully and understanding of the concepts discussed in the lecture.

1. Match each of the following changes in chromosome structure to its definition:

☒ A. Crossing

☐ B. Duplication

☐ C. Inversion

☐ D. Translocation

1a. is fusion of 2 chromosomes by their ends

1b. is presence of chromosome in duplicate

1c. is segment of one chromosome transferred to another chromosome; different, same chromosome, chromosome

1d. is fusion of 2 chromosomes (segment from one chromosome is in other)

2. How many genetically different gametes can be produced from a diploid cell with 4 pairs of chromosomes (pairs)? Explain your answer.

There are 16 genetically different gametes that can be produced (using the 2<sup>n</sup> equation to find number of chromosomes pairs, 4 chromosomes with 2 pairs chromosomes are 16 possible 2<sup>4</sup> or 16 genetically different gametes)

3. Although you inherit a combination of half from your parents, you recognize that some traits come to be independent assortment. (for example, hair color and eye color). Why may some traits be inherited together?

That's because linked together and travel on the same chromosome. (example: hair and eye color, assortment is missing, and a combination of genes only have 1 trait). recombination chromosomes from both will be found in the same chromosome in the gametes, usually, inheritance will be linked together

4. Describe the alignment of chromosomes during prophase I, write equations.

During prophase I homologous chromosomes and homologous chromosomes align together, called bivalents. This is important because it allows the crossing over to occur and results in the genetic recombination.

5. How does recombination lead to chromosomal polymorphism? Describe two types of genetic disorders that can result from recombination.
