

ILOG JRules Rule Scenario Manager

Rule testing and what-if analysis

The hard way: test rules by deploying them

Fully testing changes to an application often requires redeployment of the program to see how it performs under real conditions. This approach can be quite costly if something goes wrong, especially with enterprise-wide solutions. Business rule management systems (BRMSs) like ILOG's drive critical applications in virtually every industry. They automate decision making in systems that handle thousands of transactions and millions of dollars daily. The companies that use these solutions can ill afford faulty software.

The easy way: test rules with simulated conditions

A testing environment that applies realistic scenarios to fully validate rules before deployment minimizes risks and saves both monetary costs and the considerable stress that comes with discovering and trying to fix faulty logic in a running application. Scenario testing also shortens time to market for applications and their changes, as users spend less time checking changes and have greater confidence in their work.

ILOG's way: ILOG JRules Rule Scenario Manager

The creator of ILOG JRules, the market-leading BRMS, also provides the ultimate solution for testing business rules: ILOG JRules Rule Scenario Manager (RSM). It allows a company to create and store reusable business scenarios and apply them against business rules. This approach helps ensure deployed rules perform as required, and gives companies a means for testing different approaches to business problems. ILOG JRules RSM takes the guesswork out of writing business rules.

- Test rules before deploying
- Lower costs and reduce risk
- Deploy faster and with greater confidence
- Get the right results – the first time

Theory and Practice of Model Transformations Richard F. Paige, 2009-06-29 Models have become essential for supporting the development analysis and evolution of large scale and complex IT systems Models allow different views perspectives and elements of a system to be captured rigorously and precisely thus allowing automated tools to manipulate and manage the models In a full edged model driven engineering MDE process the transformations developed and pressed between models are also key Model transformations allow the definition and implementation of the operations on models and also provide a chain that enables the automated development of a system from its corresponding models Model transformations are already an integral part of any model driven approach and there are a number of available model transformation languages tools and supporting environments some of these approaches are now approaching maturity Nevertheless much work remains the research community and industry need to better understand the foundations and implications of model transformations such as the key concepts and operators supporting transformation languages their semantics and their structuring mechanisms and properties e.g modularity composability and parametrization The effect of using model transformations on organizations and development processes particularly when applied to ultra large scale systems or in distributed enterprises is still not clear These issues and others related to the specification design implementation analysis and experimentation with model transformation are the focus of these proceedings The Second International Conference on Model Transformation ICMT 2009 was held in late June 2009 in Zurich Switzerland

have a high impact on organizations and businesses today and are a key to globalization Evolution of complexity calls for changes in the way these systems are built and managed As a consequence a paradigm shift towards Model Driven Engineering and Policy Based Management can be observed both aiming at a better management of complexity A lot of human effort is still necessary to develop and operate complex systems In this thesis an innovative approach to reduce that effort is presented Domain specific models are used to describe the IT system and its behavior at a high level of abstraction initially They are refined into technical representations at lower levels and finally transformed into event condition action policies These executable policies define which actions must or must not be performed to achieve the objectives of the system The refinement of models and the generation of policy implementations are both fully automated As high level changes are automatically materialized in the respective policies system behavior can be adapted at runtime simply by changing the high level models This allows to operate even complex systems without considering their technical details Finally the correctness of the refinement is proven with a relational algebra The benefits of the approach are demonstrated and evaluated with two
