suggest that the balancing of effector T cells and regulatory cells in the tumor microenvironment is associated with cancer progression and prognosis. Cells and molecules involved in the control of cancer are complex and a better understanding of the tumor immune environment will lead to the development of truly effective biomarkers. This research topic will focus on novel biomarkers that predict efficacy, prognosis or the development of adverse events in various cancer immunotherapies and extensive basic research leading to the development of biomarkers. We expect a wide range of research not only in serology, genetics and immunocytochemistry but also in bacterial flora. Research on the development of novel assays and bioinformatics methods is also welcome. Non-invasive biomarkers for cancer immunotherapy: Bulk RNA-seq, scRNA-seq or Rep-seq methods. Correlation of tumor immune cells with gut microbiota in tumor immunotherapy. Impact of T_H1 and T_H2 balance in the tumor microenvironment on tumor prognosis. Inflammatory and immune signatures associated with drug response versus resistance in cancer. Please note that Topic Editor Dr Takaji Matsutani is employed by Maruho Co Ltd. The other Topic Editors declare no competing interests with regard to the Research Topic subject. Please also note that manuscripts consisting solely of bioinformatics or computational analysis of public genomic or transcriptomic databases which are not accompanied by robust and relevant validation (clinical cohort or biological validation in vitro or in vivo) are out of scope for this topic.

Molecular Approaches to Ecology and Evolution R. deSalle, B. Schierwater, 2012-12-06. Four years ago we edited a volume of 36 papers entitled *Molecular Approaches to Ecology and Evolution* (Schierwater et al. 1994) in which we attempted to put together a diverse array of papers that demonstrated the impact that the technological revolution of molecular biology has had on the field of evolutionary biology and ecology. The present volume borrows from that theme but attempts to focus more sharply on the impact that molecular biology has had on our understanding of different hierarchical levels important in evolutionary and ecological studies. Because DNA sequence variation is at the heart of every paper in the present volume we feel it necessary to examine how DNA has affected study at various levels of biological organization. The majority of the chapters in the present volume follow themes established in the earlier volume: all chapters by authors in the previous volume are either fully updated or entirely new and expand into areas that we felt were important for a more complete understanding of the impact of DNA technology on ecology and evolution. The collection of papers in this volume covers a diverse array of ecological and evolutionary questions and demonstrates the breadth of coverage molecular technology has imparted on modern evolutionary biology. There are also a broad range of hierarchical questions approached by the 17 papers in this volume.
