High Performance Computing In Power And Energy Systems Power Systems:

High Performance Computing in Power and Energy Systems Siddhartha Kumar Khaitan, Anshul Gupta, 2012-09-07

The twin challenge of meeting global energy demands in the face of growing economies and populations and restricting greenhouse gas emissions is one of the most daunting ones that humanity has ever faced. Smart electrical generation and distribution infrastructure will play a crucial role in meeting these challenges. We would need to develop capabilities to handle large volumes of data generated by the power system components like PMUs, DFRs and other data acquisition devices as well as by the capacity to process these data at high resolution via multi scale and multi period simulations cascading and security analysis interaction between hybrid systems electric transport gas oil coal etc and so on to get meaningful information in real time to ensure a secure reliable and stable power system grid. Advanced research on development and implementation of market ready leading edge high speed enabling technologies and algorithms for solving real time dynamic resource critical problems will be required for dynamic security analysis targeted towards successful implementation of Smart Grid initiatives. This book aims to bring together some of the latest research developments as well as thoughts on the future research directions of the high performance computing applications in electric power systems planning operations security markets and grid integration of alternate sources of energy etc. Transition of HPC Towards Exascale Computing

E.H. D'Hollander, 2013-10-22. The US, Europe, Japan and China are racing to develop the next generation of supercomputers, exascale machines capable of 10^{18} power calculations a second by 2020. But the barriers are daunting; the challenge is to change the paradigm of high performance computing. The 2012 biennial high performance workshop held in Cetraro, Italy, in June 2012, focused on the challenges facing the computing research community to reach exascale performance in the next decade. This book presents papers from this workshop arranged into four major topics: energy scalability, new architectural concepts and programming of heterogeneous computing systems. Chapter 1 introduces the status of present supercomputers which are still about two orders of magnitude separated from the exascale mark. Chapter 2 examines energy demands, a major limiting factor of today's fastest supercomputers; the quantum leap in performance required for exascale computing will require a shift in architectures and technology. In Chapter 3, scalable computer paradigms for dense linear algebra on massive heterogeneous systems are presented, and Chapter 4 discusses architectural concepts. Finally, Chapter 5 addresses the programming of heterogeneous systems. This book will be of interest to all those wishing to understand how the development of modern supercomputers is set to advance in the next decade. **IBM Power System S822LC for High**
