Procedure for Counting: **Counting Species by Quadrant Sampling**

- a. Remove the pot contents, measured at the quadrats previously found in a given quadratization. The different base quadrats are the different quadrats species. Consider when there are different quadrats and record the information in the table.
 - b. Take a sample of 100 from the pot. These quadrats are different quadrats from your sample area.
 - c. Species richness refers to the number of different species found in a given area, listed in the species richness of your sample table (a pot).
- For species richness see: [Species Richness](#)
- d. Species richness refers to the number of different species found in a given area. Record in the table the species richness for each species found in your sample area (a pot).
 - e. Counting the species richness for each species in the quadrats. Relative species richness is reported as a percentage. The relative species richness is calculated as (species richness / total number of quadrats in sample) x 100 (a pot).
