

IGNEOUS ROCKS

Rocks are solid mixtures of one or more minerals. The rocks on the Earth are constantly changing their shape and composition. This process is known as the rock cycle. There are three types of rocks: **sedimentary, igneous and metamorphic.**

Igneous rocks form from the **cooling and hardening** of the molten magma. Igneous rocks can form slowly by cooling under the surface or more quickly at the surface of the Earth.

Magma is when rock melts or partially melts underground. When magma cools beneath the Earth's surface, it creates **intrusive igneous rocks.** Intrusive rocks form plutons. A **pluton** is a large igneous intrusive rock that is balloon-shaped. Pegmatites are extreme igneous rocks that form during the final stage of magma's crystallization. **Pegmatites** are called extreme because they have large crystals. Intrusive rocks take a very long time to cool into a solid so the crystals that form them tend to be quite large, and they usually have quite a coarse texture. An example of an intrusive igneous rock is granite. The colored specks in granite represent different minerals or crystals.

Igneous rocks formed at the surface of the Earth are called extrusive igneous rocks. Extrusive igneous rocks form volcanoes that have lava. Lava is melted rock above the Earth's surface. The crystals in igneous extrusive rocks are very small and the texture of the rocks is fine-grained or even glassy because of how quickly they cool when they come into touch with the air. A common extrusive igneous rock is basalt. It is a dense and dark rock that is finely grained.
