

ALTERNATIVE ENERGY:

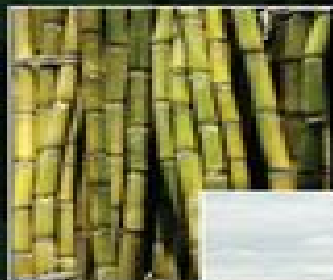

BIOMASS

Biomass is any renewable energy source from living or recently dead biological material. This usually refers to plant matter. Sources for biomass include trees, switchgrass, corn, sorghum, sugarcane, soybeans, and waste plant matter, like husks, stalks, sawdust, or even kitchen scraps that would otherwise rot in landfills.

Biomass fuels include wood burned for heat, ethanol made from corn, and biodiesel made from soybeans, both of which can be used as fuel in cars and trucks.

Biomass can be **carbon negative**. Plants used for biomass release most of the CO_2 they absorbed when they were processed or burned, but some plants, like switchgrass, can store CO_2 in the ground as well.

Ethanol Processing Plant

PROS:

- Because so many things can be converted to biomass fuels, people around the world can use what is available and cheap.
- Biomass only releases as much or less CO_2 than the plants take in during growth.
- Some biomass matter, like switchgrass, can be grown in places with poor soil where food crops, like wheat, won't grow.
- Using waste matter cuts down on the amount of garbage in landfills.
- Biomass matter can be processed into liquid fuels, like ethanol or biodiesel, that can run in cars and trucks, or it can be burned to generate electricity.

CONS:

- Burning biomass matter can release the same amount of non- CO_2 pollution as fossil fuels.
- Poor planning can lead to increased destruction of forests as people clear land to plant biomass crops. This increases the overall amount of CO_2 in the atmosphere.
- Large-scale switching from planting food crops to planting biomass crops may drive up food prices.
- Many technologies for using biomass matter are not cost-effective. It can cost more to grow or process the biomass than the fuel that is produced is worth.
- Some biomass technologies are still in the planning phase. They have not been developed yet.
