

Activity A: Alpha decay

Get the Gizmo ready:

- Click Reset (⌂).
- Check that Alpha decay and Uranium are selected.

Question: How does alpha decay change the nucleus of a radioactive atom?

Predict: As you observed in the warm-up activity, an alpha particle consists of two protons and two neutrons. How will the emission of an alpha particle affect the following?

- A. The atomic number of the atom: more protons godown 2 -2
- B. The mass number of the atom: more protons and neutrons -4

Calculate: Turn on **Write equation**. What you see is an equation that shows the original uranium atom on the left. The boxes on the right represent the **daughter product**—the atom produced by radioactive decay—and the emitted alpha particle.

- A. In the top-left box, write the mass number of the daughter product and press "Enter" on your keyboard. What is this number? 234
- B. In the bottom-left box, write the atomic number of the daughter product and press "Enter." What is this number? 90
- C. In the next set of boxes, enter the mass number and atomic number of the alpha particle, which has the same composition as the nucleus of a helium (He) atom. After filling in the boxes in the Gizmo, write the completed equation below:

- D. According to your equation, what version/**isotope** remains after the alpha decay of uranium-238? (Note: You can look up element symbols on the periodic table.)

The rule -4 = atomic # -2 = mass #

Check: Turn on **Show equation**, and click **Play**. The equation will appear at the end of the animation. Was your prediction correct? yes If not, modify your equation above.
