The flat periwinkle, shown at right, is a small snail that lives on seaweeds in the rocky intertidal of New England. The European green crab is one of the snail's top predators. As its name implies, the European green crab is not native to New England; it traveled from Europe sometime in the early 19th century. Before 1900, the green crab was not found north of Cape Cod. Since that time, however, the crab has expanded its range northward, and is now found as far north as Nova Scotia. Thus the periwinkle snails of Cape Cod are now exposed to this predator.

Seeley went on to continue her studies of the impact of the European green crab on the periwinkle population in both the field and lab. In this lab exercise, you'll explore some of the methods and findings using a computer simulation.
