Fundamental Networking in Java Esmond Pitt, 2006-02-28 The book provides complete coverage of fundamental IP networking in Java. It introduces the concepts behind TCP/IP and UDP and their intended use and purpose, gives complete coverage of Java networking APIs, includes an extended discussion of advanced server design so that the various design principles and tradeoffs concerned are discussed, and equips the reader with analytic queuing theory tools to evaluate design alternatives. It covers UDP multicasting and covers multi-homed hosts, leading the reader to understand the extra programming steps and design considerations required in such environments. After reading this book, the reader will have an advanced knowledge of fundamental network design and programming concepts in the Java language, enabling them to design and implement distributed applications with advanced features and to predict their performance. Special emphasis is given to the scalable I/O facilities of Java 1.4 as well as complete treatments of multi-homing and UDP, both unicast and multicast.
