Data-Driven Insights for Supply Chain Optimization: Frameworks and Solutions using AI Anil K Anusuru, 2025-02-08 Our supply chain SC model is based on a two tier queueing inventory system This facility delivers packages of Q_0 fixed size items from its inventory stored in a distribution centre DC to a retail shopping mall RSM This RSM processes customer requirements through an $M/M/1/K$ rule service facility Requests to the RSM node follow the Poisson process with the parameter λ The inventory guideline applied at node RSM is of type (Q_0, Q) and the order of most items Q_0 is placed on the DC when inventory decreases from Q to level 0 with a threshold guideline called f_1 policy Thus at the end of the delay the DC output of the quantity ordered by RSM is exponentially distributed with the parameter λ For each request to the RSM node an article is only available after the exponential service time with the parameter μ The waiting room at the commercial node has unlimited capacity This SC management SCM is called a queue inventory system with a f_1 policy The common stochastic process $\{Z(t), N(t), I(t)\}$ to link the number of customers demands available at time t by $N(t)$ and the on hand inventory level by $I(t)$ is formulated Because of the properties of the exponential distributions and of the f_1 policy this pair sequence $\{Z(t)\}$ forms a Markov decision process MDP that changes its states with the passage of times t The Z systems stationary properties are checked at service completion We also use the linear function of total expected cost to determine the optimal order quantity and optimal order patterns Using the same methodology the analysis is extended by assuming that the two processes are independent under a new policy f_2 Numerical illustrations are also provided to support the results obtained from the proposed MDP approach

Variational Methods for the Numerical Solution of Nonlinear Elliptic Problem Roland Glowinski, 2015-11-04 Variational Methods for the Numerical Solution of Nonlinear Elliptic Problems addresses computational methods that have proven efficient for the solution of a large variety of nonlinear elliptic problems These methods can be applied to many problems in science and engineering but this book focuses on their application to problems in continuum mechanics and physics This book differs from others on the topic by presenting examples of the power and versatility of operator splitting methods providing a detailed introduction to alternating direction methods of multipliers and

their applicability to the solution of nonlinear possibly nonsmooth problems from science and engineering and showing that nonlinear least squares methods combined with operator splitting and conjugate gradient algorithms provide efficient tools for the solution of highly nonlinear problems The book provides useful insights suitable for advanced graduate students faculty and researchers in applied and computational mathematics as well as research engineers mathematical physicists and systems engineers Architectures and Protocols for Secure Information Technology Infrastructures Ruiz-Martinez,

Antonio,Marin-Lopez, Rafael,Pereniguez-Garcia, Fernando,2013-09-30 With the constant stream of emails social networks and online bank accounts technology has become a pervasive part of our everyday lives making the security of these information systems an essential requirement for both users and service providers Architectures and Protocols for Secure Information Technology Infrastructures investigates different protocols and architectures that can be used to design create and develop security infrastructures by highlighting recent advances trends and contributions to the building blocks for solving security issues This book is essential for researchers engineers and professionals interested in exploring recent advances in ICT security **Advanced Metaheuristics: Novel Approaches for Complex Problem Solving** Erik

Cuevas,Nahum Aguirre,Oscar Barba-Toscano,Mario Vásquez-Franco,2025-05-17 This book examines a series of strategies designed to enhance metaheuristic algorithms focusing on critical aspects such as initialization methods the incorporation of Evolutionary Game Theory to develop novel search mechanisms and the application of learning concepts to refine evolutionary operators Furthermore it emphasizes the significance of diversity and opposition in preventing premature convergence and improving algorithmic efficiency These strategies collectively contribute to the development of more adaptive and robust optimization techniques The book was designed from a teaching standpoint making it suitable for undergraduate and postgraduate students in Science Electrical Engineering or Computational Mathematics Furthermore engineering practitioners unfamiliar with metaheuristic computations will find value in the application of these techniques to address complex real world engineering problems extending beyond theoretical constructs *Recent Advances on Hybrid*

Approaches for Designing Intelligent Systems Oscar Castillo,Patricia Melin,Witold Pedrycz,Janusz Kacprzyk,2014-03-26 This book describes recent advances on hybrid intelligent systems using soft computing techniques for diverse areas of application such as intelligent control and robotics pattern recognition time series prediction and optimization complex problems Soft Computing SC consists of several intelligent computing paradigms including fuzzy logic neural networks and bio inspired optimization algorithms which can be used to produce powerful hybrid intelligent systems The book is organized in five main parts which contain a group of papers around a similar subject The first part consists of papers with the main theme of type 2 fuzzy logic which basically consists of papers that propose new models and applications for type 2 fuzzy systems The second part contains papers with the main theme of bio inspired optimization algorithms which are basically papers using nature inspired techniques to achieve optimization of complex optimization problems in diverse areas of

application The third part contains papers that deal with new models and applications of neural networks in real world problems The fourth part contains papers with the theme of intelligent optimization methods which basically consider the proposal of new methods of optimization to solve complex real world optimization problems The fifth part contains papers with the theme of evolutionary methods and intelligent computing which are papers considering soft computing methods for applications related to diverse areas such as natural language processing recommending systems and optimization

Dynamical Collision Theory and Its Applications Sadhan Adhikari, 2012-12-02 Dynamical Collision Theory and Its Applications reviews some of the powerful methods that have evolved for calculating the predictions of dynamical collision theory Topics range from scattering theory to potential scattering three and four particle scattering multiparticle scattering many particle Lippmann Schwinger equations and the connected kernel approach This book is comprised of nine chapters the first of which introduces the reader to the quantum theory of scattering This topic is followed by a discussion on two particle potential scattering and various methods for calculating off shell two body amplitudes as well as approximating them by finite rank forms The next chapters focus on the interpretation and applicability of the multichannel multiparticle Lippmann Schwinger equations along with the known N particle connected kernel integral equations and their physical predictions Descriptions of contemporary field theoretical and relativistic approaches such as the Dirac phenomenology for intermediate energy nucleon nucleus scattering are included The singularity structure of multiparticle amplitudes and the associated dispersion relation techniques are also considered This book concludes by describing the relationship between the conventional optical potentials multiple scattering theories and the coupled reaction channel and resonating group methods and the few body approaches This text is primarily intended for chemists physicists and graduate students interested in general scattering theory intermediate and low energy hadron and nuclear physics atomic and molecular physics statistical mechanics and physical and quantum chemistry There are a number of topics in this book that will be interesting to both mathematicians and particle physicists as well as advanced graduate students in courses that involve collision theory
