

# Electromagnetic Induction

When a conductor and a magnetic field are moved relative to each other they generate a current or emf.

When a current carrying wire moves across the magnetic field lines, it 'cuts flux'. This 'cutting flux' generates a current or emf. The effect is magnified if we use a coil of wire: for a coil of wire of  $N$  turns, the effect is  $N$  times greater than if it were a straight wire.

With a coil, we can think of the number of *field lines linking the coil*. If there is a change in the number of field lines which pass through the coil, there will be an induced emf across the ends of the coil.

Bicycle dynamos work by electromagnetic induction. As the rider pedals, a permanent magnet turns inside a coil of wire. The rotating magnet changes the magnetic flux linking the coil. An emf is therefore induced.
