11. **Vitreous fluid:** The space between retina and eye lens is filled with a fluid called vitreous fluid. It keeps the eye wet. It is mainly composed of water. It occupies two-thirds of the volume of eye.

12. **Blind spot:** At the junction of the optic nerve and the retina, there are no sensory cells (rods or cones). So, no vision is possible at that spot. This is called the blind spot of the eye. Its existence can be demonstrated by the following activity:

ACTIVITY 5

Use Cordova Smart Class Software on the smart board in Class to perform this activity.

To show the presence of blind spot of an eye

Things needed: A white cardboard, a scale and a pencil/pen

Method:

1. Take a white cardboard and mark a thick cross on its left hand side with the help of a pencil or pen. At a distance of 8 cm, mark a round mark on the right hand side (Fig. 16.20).

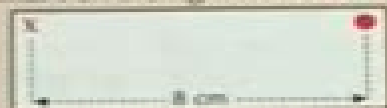

Fig. 16.20 A cardboard having a cross and a round mark on it

2. Hold the cardboard at arm's length from your eyes. Close your left eye and look continuously on the cross. You see that both cross and round marks are visible.

3. Move the cardboard slowly towards you, keeping the eye on the cross. You find at some point that round mark disappears. At this moment, the image of the round mark is formed on the blind spot and hence, it is not visible.

4. Again, hold the cardboard at an arm's length from your eyes. Now, close your right eye and look continuously on the round mark. You see that both cross and round marks are visible.

5. Move the cardboard slowly towards you, keeping the eye on the round mark. You find at some point, the cross mark disappears. At this moment, image of the cross is formed on the blind spot on the retina that cannot send messages to the brain when light falls on it.

Conclusion: There is a blind spot on the retina where there are no sensory cells (rods or cones). So, no vision is possible at this spot.

Working of the Human Eye

Let us understand the working of the human eye by the flow chart (Fig. 16.21) given below:

The light coming from an object enters the eye through the cornea and the pupil.

The lens focuses the light rays to form a real, inverted and highly diminished image on the retina.

The sensory cells (rods and cones) of the retina get activated and generate electric signals.

Optic nerves send electric signals to the brain.

The brain interprets these signals and make the erect image of the object.

DO YOU KNOW ?

(i) An owl can see in dark night. Its retina has a large number of rods and a few cones. Therefore, it can see in dim light but not in the bright light. Also, the owl has a larger cornea and a large pupil that allows more light to enter the eyes and thus, enables it to see in darkness.
