Functional Analysis Theo Bühler, Dietmar A. Salamon, 2018-08-08 It begins in Chapter 1 with an introduction to the necessary foundations including the Arzel Ascoli theorem elementary Hilbert space theory and the Baire Category Theorem Chapter 2 develops the three fundamental principles of functional analysis uniform boundedness open mapping theorem Hahn Banach theorem and discusses reflexive spaces and the James space Chapter 3 introduces the weak and weak topologies and includes the theorems of Banach Alaoglu Banach Dieudonn Eberlein mulyan Kren Milman as well as an introduction to topological vector spaces and applications to ergodic theory Chapter 4 is devoted to Fredholm theory It includes an introduction to the dual operator and to compact operators and it establishes the closed image theorem Chapter 5 deals with the spectral theory of bounded linear operators It introduces complex Banach and Hilbert spaces the continuous functional calculus for self adjoint and normal operators the Gelfand spectrum spectral measures cyclic vectors and the spectral theorem Chapter 6 introduces unbounded operators and their duals It establishes the closed image theorem in this setting and extends the functional calculus and spectral measure to unbounded self adjoint operators on Hilbert spaces

Chapter 7 gives an introduction to strongly continuous semigroups and their infinitesimal generators. It includes foundational results about the dual semigroup and analytic semigroups, an exposition of measurable functions with values in a Banach space, and a discussion of solutions to the inhomogeneous equation and their regularity properties. The appendix establishes the equivalence of the Lemma of Zorn and the Axiom of Choice and contains a proof of Tychonoff's theorem. With 10 to 20 elaborate exercises at the end of each chapter, this book can be used as a text for a one or two semester course on functional analysis for beginning graduate students. Prerequisites are first year analysis and linear algebra, as well as some foundational material from the second year courses on point set topology, complex analysis in one variable, and measure and integration.

Functional analysis Methods in numerical analysis, 1977 **Theorems and Problems in Functional Analysis** A. A. Kirillov, A. D. Gvishiani, 2011-12-13

Even the simplest mathematical abstraction of the phenomena of reality, the real line, can be regarded from different points of view by different mathematical disciplines. For example, the algebraic approach to the study of the real line involves describing its properties as a set to whose elements we can apply operations and obtaining an algebraic model of it on the basis of these properties without regard for the topological properties. On the other hand, we can focus on the topology of the real line and construct a formal model of it by singling out its continuity as a basis for the model. Analysis regards the line and the functions on it in the unity of the whole system of their algebraic and topological properties with the fundamental deductions about them obtained by using the interplay between the algebraic and topological structures. The same picture is observed at higher stages of abstraction. Algebra studies linear spaces, groups, rings, modules, and so on. Topology studies structures of a different kind on arbitrary sets, structures that give mathematical meaning to the concepts of a limit, continuity, a neighborhood, and so on. Functional analysis takes up topological linear spaces, topological groups, normed rings, modules, representations of topological groups in topological linear spaces, and so on. Thus, the basic object of study in functional analysis consists of objects equipped with compatible algebraic and topological structures.
