Leishman, 2006-04-24 Written by an internationally recognized teacher and researcher this book provides a thorough modern treatment of the aerodynamic principles of helicopters and other rotating wing vertical lift aircraft such as tilt rotors and autogiros The text begins with a unique technical history of helicopter flight and then covers basic methods of rotor aerodynamic analysis and related issues associated with the performance of the helicopter and its aerodynamic design It goes on to cover more advanced topics in helicopter aerodynamics including airfoil flows unsteady aerodynamics dynamic stall and rotor wakes and rotor airframe aerodynamic interactions with final chapters on autogiros and advanced methods of helicopter aerodynamic analysis Extensively illustrated throughout each chapter includes a set of homework problems Advanced undergraduate and graduate students practising engineers and researchers will welcome this thoroughly revised and updated text on rotating wing aerodynamics

Theoretical and Computational Aerodynamics Tapan K. Sengupta, 2014-10-20 Aerodynamics has seen many developments due to the growth of scientific computing which has caused the design cycle time of aerospace vehicles to be heavily reduced Today computational aerodynamics appears in the preliminary step of a new design relegating costly time consuming wind tunnel testing to the final stages of design Theoretical and Computational Aerodynamics is aimed to be a comprehensive textbook covering classical aerodynamic theories and recent applications made possible by computational aerodynamics It starts with a discussion on lift and drag from an overall dynamical approach and after stating the governing Navier Stokes equation covers potential flows and panel method Low aspect ratio and delta wings including vortex breakdown are also discussed in detail and after introducing boundary layer theory computational aerodynamics is covered for DNS and LES Other topics covered are on flow transition to analyse NLF airfoils bypass transition streamwise and cross flow instability over swept wings viscous transonic flow over airfoils low Reynolds number aerodynamics high lift devices and flow control Key features Blends classical theories of incompressible aerodynamics to panel methods Covers lifting surface theories and low aspect ratio wing and wing body aerodynamics Presents computational aerodynamics from first principles for incompressible and compressible flows Covers unsteady and low Reynolds number aerodynamics Includes an up to date account of DNS of airfoil aerodynamics including flow transition for NLF airfoils Contains chapter problems and illustrative examples Accompanied by a website hosting problems and a solution manual Theoretical and Computational Aerodynamics is an ideal textbook for undergraduate and graduate students and is also aimed to be a useful resource book on aerodynamics for researchers and practitioners in the research labs and the industry Exterior Ballistics George Klimi, 2014-01-27 The noteworthy findings and innovative methods of predicting projectile trajectory introduced in my books Exterior Ballistics A New Approach EBNA Xlibris 2010 and Exterior Ballistics with Applications EBA3e Xlibris third edition December 2011

require a methodical approach and further development. As a result, the amateurs and professionals interested in exterior ballistics of firearms and especially in long range shooting with small arms have a new book *Exterior Ballistics The Remarkable Methods EBRM* that aims to enrich the foundations of modern exterior ballistics and to lessen the complexity of physics and mathematics techniques in use. *Exterior Ballistics The Remarkable Methods* is a book that combines and develops further the methods introduced in *EBA3e*, *EBNA* and in the *Exterior Ballistics of Small Arms EBSA* (Xlibris 2009). The foundations of the book are mainly the findings and the innovative ballistics methods presented in *EBA3e* and *EBNA*. The remarkable methods of exterior ballistics presented in this new book include: The methods of determining the function of resistance $G(v)$ of a given bullet i using range tables or the experimental data measurements of three or four coordinates at the points of projectile impact; The model of Tangent Law of Trajectory Refraction and the related set of formulas that we use to study the trajectories of projectiles in nonstandard atmosphere; Series expansion method and the techniques of second to sixth order parabolas we employ to predict with great accuracy the projectile trajectory; The exceptional Siacci's methods that we apply as well for the projectile trajectory in nonstandard atmosphere and in inclined shooting combined with the tangent law of trajectory refraction. It is important to note that using the similarity laws of fluid dynamics we have obtained the tangent law of projectile refraction which represents a progress with respect to Newton Snell's law on projectile refraction. For better understanding of the information presented in the book, the reader should refer to my three preceding books on exterior ballistics already published by Xlibris, although most of the material is self-contained and clear enough to be accessed and assimilated by a wide range of readers. The system of units used in the book is the International System (SI). For readers that are unfamiliar with the SI system, it is not difficult to become accustomed and use the materials presented in the book to benefit from the simple illustrations, exercises, and PC programs that at the same time give answers to many problems encountered in practice. My studies and writing work in exterior ballistics intend to find new and simple mathematical models and methods to predict the elements of the projectile trajectory. I believe that I have achieved some good results which need to be further developed.
