Handbook of Combinatorial Optimization Ding-Zhu Du, Panos M. Pardalos, 2013-03-14 Combinatorial or discrete optimization is one of the most active fields in the interface of operations research computer science and applied mathematics Combinatorial optimization problems arise in various applications including communications network design VLSI design machine vision air line crew scheduling corporate planning computer aided design and manufacturing database query design cellular telephone frequency assignment constraint directed reasoning and computational biology Furthermore combinatorial optimization problems occur in many diverse areas such as linear and integer programming graph theory artificial intelligence and number theory All these problems when formulated mathematically as the minimization or maximization of a certain function defined on some domain have a commonality of discreteness Historically combinatorial optimization starts with linear programming Linear programming has an entire range of important applications including production planning and distribution personnel assignment finance allocation of economic resources circuit simulation and control systems Leonid Kantorovich and Tjalling Koopmans received the Nobel Prize 1975 for their work on the optimal allocation of resources Two important discoveries the ellipsoid method 1979 and

interior point approaches 1984 both provide polynomial time algorithms for linear programming These algorithms have had a profound effect in combinatorial optimization Many polynomial time solvable combinatorial optimization problems are special cases of linear programming e g matching and maximum flow In addition linear programming relaxations are often the basis for many approximation algorithms for solving NP hard problems e g dualheuristics *Handbook of combinatorial optimization* Dingzhu Du, Panos M. Pardalos, 1998-12-15 This is the second of a multi volume set The various volumes deal with several algorithmic approaches for discrete problems as well as with many combinatorial problems The emphasis is on late 1990s developments Each chapter is essentially expository in nature but scholarly in its treatment Pedigree Polytopes Tirukkattuppalli Subramanyam Arthanari, 2023-03-27 This book defines and studies a combinatorial object called the pedigree and develops the theory for optimising a linear function over the convex hull of pedigrees the Pedigree polytope A strongly polynomial algorithm implementing the framework given in the book for checking membership in the pedigree polytope is a major contribution This book challenges the popularly held belief in computer science that a problem included in the NP complete class may not have a polynomial algorithm to solve By showing STSP has a polynomial algorithm this book settles the P vs NP question This book has illustrative examples figures and easily accessible proofs for showing this unexpected result This book introduces novel constructions and ideas previously not used in the literature Another interesting feature of this book is it uses basic max flow and linear multicommodity flow algorithms and concepts in these proofs establishing efficient membership checking for the pedigree polytope Chapters 3-7 can be adopted to give a course on Efficient Combinatorial Optimization This book is the culmination of the author's research that started in 1982 through a presentation on a new formulation of STSP at the XIth International Symposium on Mathematical Programming at Bonn

*Programming Challenges* Steven S Skiena, Miguel A. Revilla, 2006-04-18 There are many distinct pleasures associated with computer programming Craftsmanship has its quiet rewards the satisfaction that comes from building a useful object and making it work Excitement arrives with the flash of insight that cracks a previously intractable problem The spiritual quest for elegance can turn the hacker into an artist There are pleasures in parsimony in squeezing the last drop of performance out of clever algorithms and tight coding The games puzzles and challenges of problems from international programming competitions are a great way to experience these pleasures while improving your algorithmic and coding skills This book contains over 100 problems that have appeared in previous programming contests along with discussions of the theory and ideas necessary to attack them Instant online grading for all of these problems is available from two WWW robot judging sites Combining this book with a judge gives an exciting new way to challenge and improve your programming skills

This book can be used for self study for teaching innovative courses in algorithms and programming and in training for international competition The problems in this book have been selected from over 1 000 programming problems at the Universidad de Valladolid online judge The judge has ruled on well over one million submissions from 27 000 registered users around the world to date We have taken only the best of the best the most fun exciting and interesting problems available
