

S8.0 Engine Electrical and Control System (General Information)

The RigMaster APU electronic control system consists of two main components, a Cabin Controller (CC) and a Power Module (PM), which are linked by an 8 wire, category 5e communication cable with (RJ-45) connectors at each end. The Cabin Controller is the interface sending user commands to the Power Module. The Power Module provides control intelligence to the unit by monitoring inputs and regulating outputs based on commands sent from the Cabin Controller and various engine sending units.

There are 2 versions of the RigMaster Power Module and Cabin Controller. The RP7-901 controller uses the Yellow faced RP7-902 power module. The RP50-201 controller uses the grey faced RP50-202 power module. You cannot combine the old and new components as the software in each power module is written for the functionality of the cabin controller.

RP7-901 Version 1 Controller

RP50-201 Version 2 Controller

RP7-902 Version 1 Power Module

RP50-202 Version 2 Power Module

The cabin controller displays a number of error messages intended to act as diagnostic aids. These error messages do not indicate a specific problem, but rather provide general guidelines to aid in the troubleshooting process. (See S8.2 for a list of trouble shooting codes)

Note

The cabin controller does not have any memory function to store codes. Once a button has been pushed the code will be cleared. Ensure you have the code written down prior to pressing a button as there is no way to retrieve the code once cleared.
