

MS5001 Gas Turbines

The MS5001 single shaft turbine is a compact heavy-duty prime mover designed for long life and ease of operation and maintenance. The three main features of its simple design are:

- 17-stage axial compressor
- Combustion system with 10 chambers capable of burning a wide range of fuels including natural gas, light and heavy distillates, and crude and residual oil. A DUN System is also available.
- Two-stage turbine with high energy stage design. The first-stage nozzles are cooled by the axial compressor discharge air.

The MS5001 Gas Turbine is the ideal solution for power generation where low maintenance, reliability and economy of fuel utilization are required. Low operating and investment costs make the MS5001 package power plant an economically attractive system for load generation. The MS5001 is also ideally suited for cogeneration achieving a very high fuel utilization index and considerable fuel savings. Typical applications are industrial plants for cogeneration of power and process steam or district heating systems.

As a consequence of the extremely favorable operating, maintenance and economic characteristics of the MS5001 it has been very well accepted in the industry and there are more than 2500 units in operation all over the world.

Caruvana,1978 The primary objective of the Phase I ERDA High Temperature Turbine Technology HTTT Program was to provide a Program and System Definition of the three phase program which would culminate in the testing of a Technology Readiness Vehicle TRV at the end of a six year period The TRV is designed for use in a combined cycle using coal derived fuels at a firing temperature of 2600 F growth capability to 3000 F is projected The Phase I results reported are based on a 2600 F gas turbine burning coal derived fuels The following major areas are covered overall plant design descriptions systems design descriptions turbine subsystem design combustor design phase II proposed program and phase III proposed program Details regarding final results of each of these areas are presented It is concluded that the water cooled gas turbine in combined cycle has been shown to be capable of extremely attractive levels of performance both in terms of efficiency and specific output Coupled with the ability to tolerate a wide range of coal derived fuels with minimum fuel treatment an extremely attractive system is presented for the generation of electric power Future technology development of the high firing temperature water cooled gas turbine is expected to result in the commercial introduction of this concept in combined cycles by the late 1980 s or early 1990 s **Paper** ,1985 **Water and Energy International** ,2014 *Fossil Energy* ,1977 Energy Information Abstracts Annual, 1990 ,1990 **Proceedings** ,1981 **Operator's and Unit Maintenance Manual** ,1987 Gas
