■ To High-Speed Running with Overload

When an overload is applied to the engine running at a high speed, the centrifugal force of the balls (1) increases, which causes the engine speed to drop, and the lever (2) is pulled to the right by the pressure springs (3) and (4), increasing fuel injection. Though, the lever (2) becomes ineffective in increasing fuel injection when it is stopped by the stop spring (5).

After that, when the force of tension spring (6) becomes greater than the centrifugal force of the balls, the lever (2) moves rightward to increase fuel injection, causing the engine to run continuously at a high speed.

■ To Stop Engine

When the stop lever (3) is moved to "STOP" position, the lever (2) is moved leftward and the control ball (1) is moved to the retraction position, stopping the engine.

2 CLUTCH

The clutch is located between the engine and the transmission and is operated by stepping on the clutch pedal. When the clutch pedal is depressed, the

clutch is disengaged. And when it is released, the clutch is engaged and power from the engine is transmitted to the transmission.
