Handbook of Carbohydrate-Modifying Biocatalysts Peter Grunwald, 2016-11-25 This book provides an actual overview of the structure function and application of carbohydrate modifying biocatalysts Carbohydrates have been disregarded for a long time by the scientific community mainly due to their complex structure Meanwhile the situation changed with increasing knowledge about the key role carbohydrates play in biological processes such as recognition signal transduction immune responses and others An outcome of research activities in glycoscience is the development of several new pharmaceuticals against serious diseases such as malaria cancer and various storage diseases Furthermore the employment of carbohydrate modifying biocatalysts enzymes as well as microorganisms will contribute significantly to the development of environmentally friendly processes boosting a shift of the chemical industry from petroleum to bio based production of chemicals from renewable resources The updated content of the second edition of this book has been extended by discussing the current state of the art of using recombinantly expressed carbohydrate modifying biocatalysts and the synthesis of minicellulosomes in connection with consolidated bioprocessing of lignocellulosic material Furthermore a synthetic biology approach for using DAHP dependent aldolases to catalyze asymmetric aldol reactions is presented
