

6 Acoustical methods

K.G. Foote and T.K. Stanton

6.1 INTRODUCTION

Acoustics has a significant but still rather limited history of application in zooplankton studies. Simple reasons are the relative newness and complexity of the sampling tool. It is the overall goal of this chapter to establish a background sufficient for understanding current applications and contemplating new ones.

To achieve this goal, the chapter is divided into two major parts. In the first (section 6.2), principles, sources of variability, instruments, methods of data processing and analysis, and comparative approaches are presented. In the second part (section 6.3), measurement protocols, model computations, and examples are presented.

By necessity, since the present chapter is but one in a much larger work, some topics are neglected. These include current issues such as developments in broadband systems, measurement of morphology and physical properties of animals, and integration and interpretation of acoustical measurements.

Another neglected topic is integration of acoustical and optical systems. In a sense, this is somewhat extraneous to the present goal of establishing a firm foundation for appreciating acoustical methods. Clearly, the gains to be had from integrating methodologies, while paying careful attention to the engineering side of technology, are enormous.

6.2 GENERAL DISCUSSION OF PRINCIPLES, INSTRUMENTS, TECHNIQUES, AND COMPARATIVE APPROACHES

6.2.1 Review

BACKGROUND

The methodology involved in using acoustics to study zooplankton has its roots in fisheries acoustics. As in applications in fisheries research, acoustics can be used to provide rapid synoptic information on zooplankton distributions, for example through the echo sounder (Figure 6.1) and a standard display of echo data, the echogram (Plate 1), and be used in concert with direct sampling devices such as nets and pumps. Because of broad interest in fish, including the commercial application, acoustical methods for studying fish have long been established. Initial efforts in quantitative acoustic investigations of zooplankton used fish-related methods as a basis, and these have since evolved. A major difference between studies involving fish and zooplankton is the fact that fish, as acoustic scatterers, are relatively similar, neglecting differences due to the presence or absence of a swimbladder, varying principally with size, whereas aggregations of zooplankton typically contain a number of species with vastly different acoustic proper-
