

Module 3

Learning unit 8: Interface

- We have four common types of memory:
- Read only memory (ROM)
- Flash memory (EEPROM)
- Static Random access memory (SARAM)
- Dynamic Random access memory (DRAM).
- Pin connections common to all memory devices are: The address input, data output or input/outputs, selection input and control input used to select a read or write operation.
- **Address connections:** All memory devices have address inputs that select a memory location within the memory device. Address inputs are labeled from A_0 to A_n .
- **Data connections:** All memory devices have a set of data outputs or input/outputs. Today many of them have bi-directional common I/O pins.
- **Selection connections:** Each memory device has an input, that selects or enables the memory device. This kind of input is most often called a chip select (\overline{CS}), chip enable (\overline{CE}) or simply select (\overline{S}) input.

MEMORY COMPONENT ILLUSTRATING THE ADDRESS, DATA AND CONTROL CONNECTIONS

- RAM memory generally has at least one \overline{CS} or \overline{S} input and ROM at least one \overline{CE} .
- If the \overline{CE} , \overline{CS} , \overline{S} input is active the memory device perform the read or write.
