Dolling, Arthur F. Gianelli, Glenn N. Statile, 2017-09-25 The development of physical theory is one of our greatest intellectual achievements Its products the currently prevailing theories of physics astronomy and cosmology have proved themselves to possess intrinsic beauty and to have enormous explanatory and predictive power This anthology of primary readings chronicles the birth and maturation of five such theories the heliocentric theory the electromagnetic field theory special and general relativity quantum theory and the big bang theory in the words of the scientists who brought them to life It is the first historical account that captures the rich substance of these theories each of which represents a fascinating story of the interplay of evidence and insight and of dialogue among great minds Readers sit in with Copernicus Kepler and Galileo as they overturn the geocentric universe observe the genius of Faraday and Maxwell as they discover the electromagnetic field look over Einstein's shoulder as he works out the details of relativity listen in as Einstein and Bohr argue for the soul of quantum mechanics in the Completeness Debate and watch as Hubble and others reveal the history of the universe The editors approach highlights the moments of discovery that rise from scientific creativity and the presentation humanizes the scientific process revealing the extent to which great scientists were the first to consider the philosophical implications of their work But most significantly the editors offer this as their central thesis although each was ushered in by a revolution and each contains counterintuitive elements that delayed its acceptance these five theories exhibit a continuous rational development that has led them to a permanent place in the worldview of science Accessible to the general reader yet sufficiently substantive that working scientists will find value in it The Tests of Time offers an intimate look into how physical theory has been developed by the brilliant people who have developed it *Textbooks in Print*, 1957 **Proceedings of the Central Association of Science and Mathematics Teachers** Central Association of Science and Mathematics Teachers (U.S.), 1917 Observational Tests of Cosmological Inflation T. Shanks, A.J. Banday, Richard S. Ellis, Carlos S.

Frenk, A.W. Wolfendale, 2012-12-06 This book represents the proceedings from the NATO sponsored Advanced Research Workshop entitled Observational Tests of Inflation held at the University of Durham England on the 10th 14th December 1990 In recent years the cosmological inflation model has drawn together the worlds of particle physics theoretical cosmology and observational astronomy The aim of the workshop was to bring together experts in all of these fields to discuss the current status of the inflation theory and its observational predictions The simplest inflation model makes clear predictions which are testable by astronomical observation Foremost is the prediction that the cosmological density parameter Ω should have a value negligibly different from the critical Einstein de Sitter value of 00 1 The other main prediction is that the spectrum of primordial density fluctuations should be Gaussian and take the Harrison Zeldovich form The prediction that $n = 1$ in particular leads to several important consequences for cosmology Firstly there is the apparent contradiction with the limits on baryon density from Big Bang nucleosynthesis which has led to the common conjecture that weakly interacting particles rather than baryons may form the dominant mass constituent of the Universe Secondly with $n = 1$ the age of the Universe is uncomfortably short if Ω is the Hubble constant and the ages of the oldest star clusters lie within their currently believed limits

What If There Were No Significance Tests? Lisa L. Harlow, Stanley A. Mulaik, James H. Steiger, 2016-03-02 The classic edition of What If There Were No Significance Tests highlights current statistical inference practices Four areas are featured as essential for making inferences sound judgment meaningful research questions relevant design and assessing fit in multiple ways Other options data visualization replication or meta analysis other features mediation moderation multiple levels or classes and other approaches Bayesian analysis simulation data mining qualitative inquiry are also suggested The Classic Edition's new Introduction demonstrates the ongoing relevance of the topic and the charge to move away from an exclusive focus on NHST along with new methods to help make significance testing more accessible to a wider body of researchers to improve our ability to make more accurate statistical inferences Part 1 presents an overview of significance testing issues The next part discusses the debate in which significance testing should be rejected or retained The third part outlines various methods that may supplement significance testing procedures Part 4 discusses Bayesian approaches and methods and the use of confidence intervals versus significance tests The book concludes with philosophy of science perspectives Rather than providing definitive prescriptions the chapters are largely suggestive of general issues concerns and application guidelines The editors allow readers to choose the best way to conduct hypothesis testing in their respective fields For anyone doing research in the social sciences this book is bound to become must reading Ideal for use as a supplement for graduate courses in statistics or quantitative analysis taught in psychology education business nursing medicine and the social sciences the book also benefits independent researchers in the behavioral and social sciences and those who teach statistics

Ultracold Atoms for Foundational Tests of Quantum Mechanics Robert J. Lewis-Swan, 2016-06-25 This thesis presents a theoretical investigation into the creation and exploitation of quantum correlations and entanglement among ultracold atoms Specifically it focuses on these non classical effects in two contexts i tests of local realism with massive particles e g violations of a Bell inequality and the EPR paradox and ii realization of quantum technology by exploitation of entanglement for example quantum enhanced metrology In particular the work presented in this thesis emphasizes the possibility of demonstrating and characterizing entanglement in realistic experiments beyond the simple toy models often discussed in the literature The importance and relevance of this thesis are reflected in a spate of recent publications regarding experimental demonstrations of the atomic Hong Ou Mandel effect observation of EPR entanglement with massive particles and a demonstration of an atomic SU 1 1 interferometer With a separate chapter on each of these systems this thesis is at the forefront of current research in ultracold atomic physics
