

Solving Inequalities

Solving inequalities is similar to solving equations, but where an equation has one unique solution, an inequality has a range of solutions.

To solve an inequality we calculate the values that an unknown variable can be in that inequality.

 Example

$$\begin{aligned}2x + 1 &< 9 \\2x &< 8 \\x &< 4\end{aligned}$$

Multiplying or dividing by a negative number **changes the direction of the inequality**.

 Example

$$\begin{aligned}1 - 2x &< 9 \\-2x &< 8 \\x &> -4\end{aligned}$$

The Effect of Using Multiple Representations on Student Success in Solving Rational, Radical, and Absolute Value Equations and Inequalities Kip Wood, 2006 Because of an emerging body of research and a wealth of classroom experiences the National Council of Teachers of Mathematics adopted representation as a process standard in 2000 to add to the four previously adopted 1989 process standards problem solving reasoning and proof connections and communication The purpose of this study was to determine the effect of using multiple representations on learning to solve equations at the grade 11 level The sources of data included three unit test scores for two different groups over a seven week period prior to the treatment and a test score for the two groups after the treatment Because of small class sizes 23 and 26 the statistical results need to be verified in future studies with larger groups However the results of this study indicate that students benefit from a multi

representational approach to equation solving Students in the experimental group chose the graphing method of solving equations more often than the algebraic method and had more success with graphing compared to the algebraic approach However on some questions students in the experimental group scored lower with the graphical method than the algebraic method These results indicate that teachers need to weigh the benefits of teaching mathematical concepts with more than one representation against the costs of the learning demands placed on the student

Equations and Inequalities Jiri Herman, Radan Kucera, Jaromir Simsa, 2000-03-23 A look at solving problems in three areas of classical elementary mathematics equations and systems of equations of various kinds algebraic inequalities and elementary number theory in particular divisibility and diophantine equations In each topic brief theoretical discussions are

followed by carefully worked out examples of increasing difficulty and by exercises which range from routine to rather more challenging problems While it emphasizes some methods that are not usually covered in beginning university courses the book nevertheless teaches techniques and skills which are useful beyond the specific topics covered here With approximately 330 examples and 760 exercises

How Does Using a Model-centered Approach to Teaching Linear Equations Affect Students' Attitudes about Learning Mathematics? David Earl Pugh, 2013 This study addresses the effect that the use of interactive diagrams from GeoGebra and a focus on four representations has on students attitudes toward learning linear equations The key attitudes assessed are built on Schoenfeld s findings of mathematical attitudes commonly found in students and the Efficacy Institute s student survey built on the findings of Carol Dweck Mixed methods were used A pre and post unit survey identified key attitude changes and student interviews provided a depth of understanding as well as the student perspective of the attitude changes Participants in the study were students of the researcher at an alternative learning center in Minnesota Results indicate a positive student response in efficacy attitudes but with the object of the attitude change being the teacher rather than the technology Students demonstrated a deeper understanding of math as a system but still viewed assignments and assessments as a process of following steps to obtain the correct answer

Kinesthetic Learning in Algebra and Its Effects on Students' Achievement and Disposition Toward Mathematics Christy L. Horning, 2017 Abstract This quantitative study investigated the effects of kinesthetic learning in an Algebra class in Southern California Students in this class had not passed Algebra content and were retaking the course for a passing grade as a requirement to graduate from high school Thirty four students eighteen females and sixteen males consisting of sophomores juniors and one senior represented the make up of the class Students were provided eight kinesthetic interventions in algebra content on exponential equations and functions This study measured student achievement and disposition toward math using four instruments a pre and post test and a pre and post disposition survey The independent and paired t tests were used to compare mean scores between the pre and post tests and between the pre and post disposition surveys among the whole class and between gender groups Overall the study found one statistically significant result which was a negative change in student disposition from the pre to post test on the disposition survey Other tests revealed no statistically significant differences
