smart systems for different types of vehicles is accelerating with the advent of new emerging technologies such as connected and autonomous vehicles To ensure that these new systems and functions work as intended flexible and credible evaluation tools are necessary One example of this type of tool is a driving simulator which can be used for testing new and existing vehicle concepts and driver support systems When a driver in a driving simulator operates it in the same way as they would in actual traffic you get a realistic evaluation of what you want to investigate Two advantages of a driving simulator are 1 that you can repeat the same situation several times over a short period of time and 2 you can study driver reactions during dangerous situations that could result in serious injuries if they occurred in the real world An important component of a driving simulator is the vehicle model i e the model that describes how the vehicle reacts to its surroundings and driver inputs To increase the simulator realism or the computational performance it is possible to divide the vehicle model into subsystems that run on different computers that are connected in a network A subsystem can also be replaced with hardware using so called hardware in the loop simulation and can then be connected to the rest of the vehicle model using a specified interface The technique of dividing a model into smaller subsystems running on separate nodes that communicate through a network is called distributed simulation This thesis investigates if and how a distributed simulator design might facilitate the maintenance and new development required for a driving simulator to be able to keep up with the increasing pace of vehicle development For this purpose three different distributed simulator solutions have been designed built and analyzed with the aim of constructing distributed simulators including external hardware where the simulation achieves the same degree of realism as with a traditional driving simulator One of these simulator solutions has been used to create a parameterized powertrain model that can be configured to represent any of a number of different vehicles Furthermore the driver s driving task is combined with the powertrain model to monitor deviations After the powertrain model was created subsystems from a simulator solution and the powertrain model have been transferred to a Modelica environment The goal is to create a framework for requirement testing that guarantees sufficient realism also for a distributed driving simulation The results show that the distributed simulators we have developed work well overall with satisfactory performance It is important to manage the vehicle model and how it is connected to a distributed system In the distributed driveline simulator setup the network delays were so small that they could be ignored i e they did not affect the driving experience However if one gradually increases the delays a driver in the distributed simulator will change his her behavior The impact of communication latency on a distributed simulator also depends on the simulator application where different usages of the simulator i e different simulator studies will have different demands We believe that many simulator studies could be performed using a distributed setup One issue is how modifications to the system affect the vehicle model and the desired behavior This leads to the need for methodology for managing model requirements In order to detect model deviations in the simulator environment a monitoring aid has been implemented to help notify test managers when a model behaves strangely or is driven outside of

its validated region Since the availability of distributed laboratory equipment can be limited the possibility of using Modelica which is an equation based and object oriented programming language for simulating subsystems is also examined Implementation of the model in Modelica has also been extended with requirements management and in this work a framework is proposed for automatically evaluating the model in a tool **Lemon-Aid New Cars and Trucks 2013** Phil Edmonston,2012-12-01 Canada s automotive Dr Phil says there s never been a better time to buy a new car or truck thanks to a stronger Canadian dollar a worldwide recession driving prices downward and a more competitive Japanese auto industry that s still reeling from a series of natural disasters **Torque** ,2008-01 Singapore s best homegrown car magazine with an editorial dream team driving it We fuel the need for speed **Lemon-Aid New Cars and Trucks 2012** Phil Edmonston,2011-12-03 Offers advice for prospective buyers of cars and trucks reveals information on secret warranties and confidential service bulletins and tells how to complain and get results *Automotive Transmissions* Harald Naunheimer,Bernd Bertsche,Joachim Ryborz,Wolfgang Novak,2010-11-09 This book gives a full account of the development process for automotive transmissions Main topics Overview of the traffic vehicle transmission system Mediating the power flow in vehicles Selecting the ratios Vehicle transmission systems basic design principles Typical designs of vehicle transmissions Layout and design of important components e g gearshifting mechanisms moving off elements pumps retarders Transmission control units Product development process Manufacturing technology of vehicle transmissions Reliability and testing The book covers manual automated manual and automatic transmissions as well as continuously variable transmissions and hybrid drives for passenger cars and commercial vehicles Furthermore final drives power take offs and transfer gearboxes for 4 WD vehicles are considered Since the release of the first edition in 1999 there have been a lot of changes in the field of vehicles and transmissions About 40% of the second edition s content is new or revised with new data *Basic Course in Race Car Technology* Lars Frömmig,2023-03-28 The focus of the book is on the driving dynamics of racing vehicles The interaction of the tyre the aerodynamics of the chassis and the limited slip differential specific to racing vehicles is dealt with A chapter on the basics of vehicle dynamics makes it possible to get started with this topic even without prior automotive engineering training A historical review and a consideration of the essential safety aspects create an understanding of higher level requirements which are specified for example by the technical regulations *Popular Science* ,1967-09 Popular Science gives our readers the information and tools to improve their technology and their world The core belief that Popular Science and our readers share The future is going to be better and science and technology are the driving forces that will help make it better **World Cars** ,1985
