New numerical approaches to model hydraulic fracturing in tight reservoirs with consideration of hydro-mechanical coupling effects Lei Zhou,2014-03-20 In this dissertation two new numerical approaches for hydraulic fracturing in tight reservoir were developed A more physical based numerical 3D model was developed for simulating the whole hydraulic fracturing process including fracture propagation closure and contact as well as proppant transport and settling In this approach rock formation pore and fracture systems were assembled together in which hydro mechanical coupling effect proppant transport and settling as well as their influences on fracture closure and contact were fully considered A combined FDM and FVM schema was used to solve the problem Three applications by using the new approach were presented The results illustrated the whole hydraulic fracturing process well and seemed to be logical which confirmed the ability of the developed approach to model the in situ hydraulic fracturing operation from injection start till fully closure In order to investigate the orientation problem of hydraulic fracturing in tight reservoir a new approach for simulating arbitrary fracture propagation and orientation in 2D was developed It was solved by a hybrid schema of XFEM and FVM Three numerical studies were illustrated which proved the ability of the developed approach to solve the orientation problem in field cases

Optimization of Multistage Hydraulic Fracturing Treatment for Maximization of the Tight Gas Productivity Mengting Li,2018-12-17 Hydraulic fracturing is essential technology for the development of unconventional resources such as tight gas So far there are no numerical tools which can optimize the whole process from geological modeling hydraulic fracturing until production simulation with the same 3D model with consideration of the thermo hydro mechanical coupling

In this dissertation a workflow and a numerical tool chain were developed for design and optimization of multistage hydraulic fracturing in horizontal well regarding a maximum productivity of the tight gas wellbore After the verification a full 3D reservoir model is generated based on a real tight gas field in the North German Basin Through analysis of simulation results a new calculation formula of FCD was proposed which takes the proppant position and concentration into account and can predict the gas production rate more accurately However not only FCD but also proppant distribution and hydraulic connection of stimulated fractures to the well geological structure and the interaction between fractures are determinant for the gas production volume Through analysis the numerical results of sensitivity analysis and optimization variations there is no unique criterion to determine the optimal number and spacing of the fractures it should be analyzed firstly in detail to the actual situation and decided then from case to case
