The Circulatory System The Open The Open Courses Library, 2019-11-17 The Circulatory System Biology Most animals are complex multicellular organisms that require a mechanism for transporting nutrients throughout their bodies and removing waste products The circulatory system has evolved over time from simple diffusion through cells in the early evolution of animals to a complex network of blood vessels that reach all parts of the human body This extensive network supplies the cells tissues and organs with oxygen and nutrients and removes carbon dioxide and waste which are byproducts of respiration Gas exchange is one essential function of the circulatory system A circulatory system is not needed in organisms with no specialized respiratory organs because oxygen and carbon dioxide diffuse directly between their body tissues and the external environment However in organisms that possess lungs and gills oxygen must be transported from these specialized respiratory organs to the body tissues via a circulatory system Therefore circulatory systems have had to evolve to accommodate the great diversity of body sizes and body types present among animals Chapter Outline Overview of the Circulatory System Components of the Blood Mammalian Heart and Blood Vessels Blood Flow and Blood Pressure Regulation The Open Courses Library introduces you to the best Open Source Courses
