The Earth's Hydrological Cycle L. Bengtsson, R.-M. Bonnet, M. Calisto, G. Destouni, R. Gurney, J. Johannessen, Y. Kerr, W.A. Lahoz, M. Rast, 2014-05-02 This book gives a comprehensive presentation of our present understanding of the Earth's Hydrological cycle and the problems consequences and impacts that go with this topic Water is a central component in the Earth's system It is indispensable for life on Earth in its present form and influences virtually every aspect of our planet's life support system On relatively short time scales atmospheric water vapor interacts with the atmospheric circulation and is crucial in forming the Earth's climate zones Water vapor is the most powerful of the greenhouse gases and serves to enhance the tropospheric temperature The dominant part of available water on Earth resides in the oceans Parts are locked up in the land ice on Greenland and Antarctica and a smaller part is estimated to exist as groundwater If all the ice over the land and all the glaciers were to melt the sea level would rise by some 80 m In comparison the total amount of water vapor in the atmosphere is small it amounts to 25 kg m² or the equivalent of 25 mm water for each column of air Yet atmospheric water vapor is crucial for the Earth's energy balance The book gives an up to date presentation of the present knowledge Previously published in Surveys in Geophysics Volume 35 No 3 2014

c1994 *Hydrologic Science Priorities for the U.S. Global Change Research Program* National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Committee on Hydrologic Science, 1999-11-04 The availability of fresh water is potentially one of the most pervasive crises of the coming century Water related decisions will determine the future of major ecosystems the health of regional economies and the political stability of nations A vigorous program of research in hydrologic sciences can provide the basis for sound water management at local regional national and international levels The Committee on Hydrologic Science was established by the National Research Council in 1999 to identify priorities for hydrologic science that will ensure its vitality as a scientific discipline in service of societal needs This charge will be performed principally through a series of studies that provide scientific advice on the hydrologic aspects of national program and U S hydrologic contributions to international programs This first report contains a preliminary assessment of the hydrologic science content of the U S Global Change Research Program USGCRP Because this is a short and focused report little effort is spent to reaffirm the established and successful elements of the USGCRP In fact the Committee generally endorses the findings of the National Research Council NRC report Global Environmental Change Research Pathways for the Next Decade NRC 1998a the so called Pathways report in this respect Instead the attention here is directed toward the most critical missing hydrologic science elements in the FY2000 USGCRP This brings the focus to the terrestrial component of the water cycle The integrative nature of terrestrial hydrology could significantly strengthen the USGCRP **A comprehensive Guide for Groundwater Science** Chaitanya S Agarwal, 2025-02-14

Groundwater studies require a systematic approach beginning with reconnaissance surveys and desk studies and progressing to the establishment of monitoring wells and water level measurements These activities provide data that enable hydrogeologists to model groundwater flow assess aquifer properties and plan sustainable water extraction strategies Proper well inventories and monitoring also contribute to understanding the effects of groundwater withdrawal and help inform sustainable water management policies The use of maps in groundwater studies is essential as they allow hydrogeologists to visualize topographical geological and hydrological information Maps like hydrogeological maps soil maps and isopleth contour maps help identify recharge and discharge zones groundwater flow direction and aquifer properties Such tools are invaluable for planning well placement managing groundwater quality and assessing contamination risks The integration of various mapping techniques allows for more informed decision making which is crucial for sustainable groundwater management An important focus of the book is on groundwater recharge both natural and artificial Given the rapid depletion of groundwater resources in many regions artificial recharge methods such as rooftop rainwater harvesting RWH construction of inverted recharge wells and other techniques provide solutions to replenish aquifers However it s also

highlighted that not all recharge methods are suitable for every region and factors like soil type land use and climate play a significant role in their effectiveness Geomorphological studies and morphometric analysis offer insights into groundwater potential zones These analyses provide a deeper understanding of how the landscape influences groundwater recharge and availability helping hydrogeologists to identify high potential areas for groundwater extraction and management Moreover the focus on pumping tests aquifer parameter determination and groundwater budget techniques helps to quantify the amount of water that can be sustainably extracted without harming the aquifer system This is particularly important in regions facing acute water shortages or contamination risks as over extraction can cause irreversible damage to groundwater resources The sustainability of groundwater systems is the overarching theme of this book Exceeding the sustainable yield of aquifers has serious consequences not only for water availability but also for agriculture industries and society at large A properly managed groundwater budget ensures that withdrawals do not outpace the natural or artificial recharge of aquifers Therefore managing groundwater sustainably must include careful planning monitoring and adjusting extraction rates based on real time data and scientific modelling Groundwater quality is equally crucial as contaminated groundwater can pose serious risks to public health and ecosystems The book underscores the importance of regular monitoring and the development of water quality maps to identify contamination sources and manage them effectively Additionally it explores methods to improve water quality which is especially important for ensuring the safe use of groundwater for drinking and irrigation This book provides a comprehensive framework for understanding managing and protecting groundwater resources from basic hydrogeological principles to advanced mapping recharge techniques and policy recommendations it offers essential guidance for hydrogeologists policymakers and water resource managers

Review of the GAPP Science and Implementation Plan National Research Council, Division on Earth and Life Studies, Board on Atmospheric Sciences and Climate, Committee to Review the GAPP Science and Implementation Plan, 2005-11-27 Water managers rely on predicting changes in the hydrologic cycle on seasonal to interannual time frames to prepare for water resource needs Seasonal to interannual predictability of the hydrologic cycle is related to local and remote influences involving land processes and ocean processes such as the El Niño Southern Oscillation Although advances in understanding land surface processes show promise in improving climate prediction incorporating this information into water management decision processes remains a challenge since current models provide only limited information for predictions on seasonal and longer time scales To address these needs the Global Energy and Water Cycle Experiment GEWEX Americas Prediction Project GAPP was established in 2001 to improve how changes in water resources are predicted on intraseasonal to interannual time scales for the continental United States The GAPP program has developed a science and implementation plan to guide its science activities which describes strategies for improving prediction and decision support in the hydrologic sciences This report by the National Research Council provides a review of the GAPP Science and

Implementation Plan outlining suggestions to strengthen the plan and the GAPP program overall *LAWS* ,1987
